RE: Reconnaissance Level Characterization Report (RLCR) for Group C Facilities

Dear Mr. Legare:

The Colorado Department of Public Health and Environment, Hazardous Materials and Waste Management Division (the Division) has reviewed the RLCR for Group C Facilities, Revision 0 (dated August 9, 2000) received on September 13, 2000. The Group C RLCR includes T331A, T331, T771D, T750E, T903A, B331A and B987. The Division is hereby concurring with the Type 1 designation for T331A, T331, T771D, T750E, T903A, and B987 as identified in the Group C RLCR.

The Division does not concur at this time with the Type 1 designation for B331A because of concerns with the elevated radioactive material that was detected on the roof. The roof of B331A is identified in section 2.1, page 11, as being constructed of "Transite". Since this is not the same material, nor similar roof surface as the other trailers (which are metal roofs), the Division is concerned with the inference made that the elevated reading is due to Po-210 and not DOE-added material. Please provide specific information that identifies the nature of this radioactive material, and/or specific remediation to be performed, or re-classification as a Type 2 building.

In addition, the 4 cement footers under B331A need to be characterized for proper disposal. As such, please indicate the characterization to be performed and disposition of these cement footers. Table 5-1 also needs to be modified to include these footers as part of the Waste to be generated from B331A, as concrete waste.

If you have any questions regarding this correspondence please contact David Kruchek at (303) 692-3328.

Sincerely,

Steven H. Gunderson
RFCA Project Coordinator

EXECUTIVE SUMMARY

A Reconnaissance Level Characterization (RLC) was performed to dispose of Group C Facilities (B331A, B987, T331A, T771D, T331, T750E and T903A) as waste. The RLC encompassed both radiological and chemical characterization. Because the structures were classified as MARSSIM Class 3 (RFCA Type 1) facilities, the RLC also implemented a Pre-Demolition (Final Status) Survey design to determine whether the structures can be released (off the site). Physical, chemical and radiological hazards were assessed based on historical reviews, process knowledge, and newly acquired RLC data.

Results indicate that no radioactive or chemical contamination exists and that no significant physical hazards are present. T331A, T750E, B331A and B987 contain non-friable ACM, and disposal of ACM will require notification of the State and the waste disposal facility. Based on the assessment, all seven facilities are confirmed to be Type I facilities and can be disposed of as sanitary waste.

1.0 INTRODUCTION

As part of the Rocky Flats Environmental Technology Site (RFETS) Closure Project, numerous facilities will be removed. Among these are the Group C Facilities (B331A, B987, T331A, T771D, T331, T750E and T903A). B331A is located in the western part of the Industrial Area near the corner of Fourth and Sage; B987 is located on the east end of the Industrial Area near the Northeast Perimeter Road; T331A is located in the western part of the Industrial Area just east of B331; T771D is located in the 280 yard; and T331, T750E and T903A are located in the Property Utilization and Disposal (PU&D) Yard. The Group C Facilities are shown in Exhibit 1-1. These facilities no longer support the RFETS mission and need to be removed to reduce Site infrastructure, risks and/or operating costs.

Before the facilities can be removed and disposed, hazards must be identified. Hazards will be used to plan compliant waste disposal. This document presents the existing physical, radiological and chemical hazards associated with the seven facilities, and classifies the facilities pursuant to the RFETS Decommissioning Program Plan (DPP; K-H, 1999). The hazards assessment is based on facility history and process knowledge, operating and spill records, and results of the reconnaissance level characterization (RLC). The RLC was conducted pursuant to the RFETS Decontamination and Decommissioning Characterization Protocol (DDCP; K-H 1999). The content and outline of this RLC report (RLCR) are consistent with the Kaiser-Hill (K-H) Facility Disposition Program Manual (FDPM; K-H, 1998).

1.1 Purpose

The purpose of this report is to communicate and document the results of the RLC effort. The purpose includes summarizing the data into a concise, usable format and interpreting the data for use in management decisions, primarily:

- Definition of individual hazards and overall risk associated with facility decontamination and decommissioning (D&D);
- Typing of facilities based on hazards identified; and
- Waste classification to enable compliant disposal.

1.2 Scope

This report covers physical, radiological and chemical characterization of Group C Facilities (B331A, B987, T331A, T771D, T331, T750E and T903A). Based on the hazards identified, the facilities were typed and assessed against waste disposal criteria. Environmental media beneath and surrounding the facilities are not within the scope of this characterization. Both facilities and environmental media will be dispositioned pursuant to the Rocky Flats Cleanup Agreement (RFCA).

13

2.0 FACILITY DESCRIPTIONS AND OPERATING HISTORIES

2.1 Building 331A

Building 331A was constructed in approximately 1964. This building is located at Sage Avenue and Fourth Street, directly north of Building 335. The size of Building 331A is approximately 12' long by 10' wide and approximately 12' high. The facility has one double-door entry, which is approximately 5' wide by 10' high and located on the east end of the building. The facility has no windows. The walls are constructed of Transite® and corrugated metal, and the roof is constructed of Transite®. The roof of the building slopes to the north for drainage. The building itself has settled to the northwest. The building has concrete caisson/cable anchor tie-downs, one in each corner of the building. The floor is 3/4" rock/gravel. The base of the building is a fabricated metal framework covered with sheet metal approximately 4' high. The base looks as though it was designed to raise the height of the building's original design by approximately 4'. At the roof height there are two 4" X 4" X 14' wood timbers, which were probably used to lift the building while the base section was installed. The building presently has no lights or electrical power, but there is an 110-Volt light switch inside the door (i.e., the building had lights and/or some kind of electrical device some time in the past). Building 331A does not have any kind of building heating system. There is a 1" water line on the northwest corner of the building leading up to the roof. At one time, the line was connected to a fire sprinkler head and was used for training purposes.

The facility was used for storage of fire extinguishers and other equipment by the Fire Station and the Fire Station Training Department. Building 331A is presently totally empty and has not been used for approximately one year. The building is located on three Individual Hazardous Substance Sites (IHSSs; IHSS 134-North, IHSS 128, and IHSS 171).

2.2 Building 987

Building 987 was constructed in approximately 1960. This building is located southeast of Building 993, near the Bunker Storage. The building has a poured concrete footing/foundation/floor with a 6" raised concrete base for the cinderblock wall construction (the entry door does not have this 6" raised concrete base). The building is approximately 9' 4" long by 7' 4" wide and approximately 9' high. The facility has one door entry, which is located on the southwest corner of the building. The facility has one 28" x 28" glass-block window (16 7" x 7" x 4" thick glass blocks) on the north wall. The roof is constructed of corrugated Transite® approximately 3/4 " thick, and slopes down to the north for drainage. The door, walls, and the only storage shelf all have grounding straps attached. The east and west walls have outside air louvers (one on each wall), which are approximately 16" above grade and approximately 8" x 16". The building has electric power, but no lights or heating. The electrical power consists of a 480-volt transformer and an on-off switchbox on the west wall and an on-off switchbox on the north wall. None of the electrical power is hooked up to any equipment; there is no

electrically operated equipment in the building. The building appears to be in poor condition from water damage to the door. The concrete/cinderblock headers above the door and above the glass-block window are heavily cracked. The northeast corner of the north wall has a lot of concrete mortar missing.

Building 987 was used for storage of CS/CN gas cylinders (a low-level tear gas on hand for demonstrations), security seals for Plant Protection, and other security supply items during the past 20 years. Plant Protection removed all of their stored items during 1998. Previously boxes of explosives were stored in the building. No other known chemicals were used or stored. Items left in the building are Styrofoam® insulation blocks, 2" x 4" x 6' lumber pieces, a sheet of Tuffak® polycarbonate, and scrap pieces of polycarbonate on the floor. The building is not located on an IHSS or Potential Area of Concern (PAC).

2.3 Trailer 331A

This trailer was brought on to the plant site in 1964, and where it was used is unknown until 1979 when it was moved to its present location east of the fire station. It has an old property tag that indicates that it was under control of someone in Building 778. Also, Property Management indicated that it was at one time located near Building 371and used as an office trailer, and at another time it was located in a trailer complex where PAC 1 is now located. This trailer is approximately 40' long, 10' wide and 8' high with a 2' skirt. There are two entrances to the trailer, one on the northeast side and the other on the southwest side. The entrances have wooden steps leading up to a plywood-covered platform. The original siding has been painted over. The interior consists of three rooms, a small office on the north end, a large center room that was sleeping quarters for the women fire fighters, and shower-toilet facilities in a room in the south end. The interior walls have been painted over and may be Masonite. The ceiling composition cannot be determined as it has also been painted over, but consists of panels that are 2 feet wide and run the width of the trailer long. The floor is carpeted and has a linoleum section in front of the entrances and the shower facility. The utilities for this trailer include two window-mounted air conditioners, a wall-mounted electric heater, a fire sprinkler system, and smoke detectors. It is connected to the Plant fire alarm and public address (LSDW) systems. Hot water for the shower-toilet comes from a 52-gallon electric hot-water heater, which is in a small room in the southeast corner of the sleeping quarters.

The use of this trailer in the 15 years before it was moved to its present position is unknown, but it probably was used as offices. It is unknown what the original configuration was, but it was remodeled when it became sleeping quarters for the women fire fighters. The shower-toilet room is of welded steel walls, floor, and ceiling. Currently the fire department uses the trailer for training purposes. The trailer's current location is not an IHSS or PAC. A Facility Interview Checklist was not prepared for this facility.

16

2.4 Trailer 771D

This trailer is now located in the B280 Yard awaiting disposal. It was originally placed (in 1969) in the T771 Trailer Complex, which is located to the west of PAC 3. This unit is 12' x 40' x I0' high. It is a single-wide trailer with baked on painted corrugated sheet metal siding. The roof is also metal. Metal skirting is attached on all sides, and galvanized and unpainted. There are two weather-protected entries, both on the north side of the trailer. The entries are constructed of plywood, including the platforms and steps, and are approximately 3' - 6" above grade. There are a total of 12 windows in the trailer (5 in the north wall, 5 in the south wall, and 2 in the west wall). The floor covering is carpet, and the ceiling material is hardboard held in place with 1" wide nailed batten strips. The east end of the unit has a dry-wall partitioned space approximately 12' x I6'. The walls are painted. The unit has two roof-mounted A/C units and a forced-air heating unit located about midway on the south wall, which has a 2'-6" high vent stack. There is fire protection piping inside, including the manifold and pressure gauge in the northwest corner of the trailer. The trailer has a pair of emergency lights on the north wall and a gas line underneath the trailer for the furnace. The A/C disconnect box and the circuit box for outlets, lights and A/C are located inside of the trailer.

The trailer has always been used for office space for various groups and organizations. Dow brought in this unit in 1969 for contract engineers supporting utilities upgrades for B771. In 1970 Swinerton-Wahlberg Construction Company personnel took it over and occupied until 1975. Then sometime in 1975, J. A. Jones took over the trailer and occupied it until 1989. EG&G Construction Management occupied it in 1990 until the fire department condemned it that year because of the low ceiling. Since 1992 the trailer has been used for storage for excess material prior to going to PU& D Yard (e.g., computer equipment, office chairs, telephone equipment, filled boxes of paper, and other building supplies). Its past location is not part of an IHSS or PAC.

2.5 Trailer 331

This trailer is a 27' x 8' combination shower and toilet, skid-mounted facility. Its present condition is poor, as both exterior doors are missing, all electric lights and switches have been removed, and the shower room exhaust fan has fallen out and is hanging by its electric connection. The toilets have been removed. The exterior aluminum siding has been damaged in one corner. An exterior wall unit is installed at the toilet end of the trailer that supplied heating and air conditioning.

This trailer was in the PU&D Yard south of the WSI firing range from February 1995 to the summer of 2000. It is now located in the B280 Yard. It is not known what organizations previously used the facility and where it was used.

2.6 Trailer 750E

This trailer is a 20' x 10' restroom facility. Its present condition is very poor, as almost all

of the aluminum siding is gone, and some of the exterior wood sheathing is also gone. The interior has weather damage as the doors have stood open or sealed poorly and water has gotten in. One of stall doors in the women's side has partially come loose from the wall and is hanging down. An exterior wall unit at the end of the trailer supplied heating and cooling.

This trailer was in the PU&D yard south of the WSI firing range from January 1993 until the summer of 2000, when it was relocated to the B280 Yard. It was purchased in April of 1984. Aerial photographs indicate that it was located at the 750 trailer complex until it was sent to the PU&D Yard in 1993. It is not known what organizations previously used the facility. A Facility Interview Checklist was not prepared for this facility.

2.7 Trailer 903A

The trailer is 46' long by 9'10" wide and 8' high. The trailer is divided into three rooms. The west room (which is 13' x 8'4" x 8' high) has a furnace on the west wall, a closet, and a storage shelf. The middle room (which is 20'5" x 8'4" x 8' high) is empty. The east room (which is 9'4" x 8'4" x 7'7" high) is a shower room, which was used only for storage of equipment and supplies for the last ten years. The unit was manufactured in March 1961 and was put into service at the RFETS in 1978.

The trailer was used for the conduct of various particle studies and staging of uncontaminated air sampling equipment and supplies. Studies focused on the transport of particles in air and soil. Uncontaminated particles were studied. The trailer was installed approximately 50' south of the 903 Pad in approximately 1978. In 1991 or 1992 the trailer was relocated to the Mound Area and continued to operate until approximately 1995 or 1996. Equipment used in the trailer consisted of air sampling pumps, a microscope, a laser particle counting devise and other laboratory support equipment. Known chemicals used in this laboratory facility were cleaning chemicals, isopropyl alcohol, fluorescent beads, various powders used for air sampling, and motor oil for the air sampling equipment. In 1996 or 1997 the trailer was emptied of all equipment and was relocated to the PU&D Yard, approximately 50 yards southeast of the entrance gate of the PU&D Yard near the Firing Range. During the summer of 2000, the trailer was moved to the B280 Yard. Previous locations may be part of Site IHSSs (e.g., 109 or 183 in Operable Unit 2). A Facility Interview Checklist was not prepared for this facility.

3.0 SUMMARY OF CHARACTERIZATION ACTIVITIES

An RLC was designed to demonstrate that DOE-added radioactive materials are not present or have been removed to the extent that residual levels of contamination are below the Derived Concentration Guideline Levels (DCGLs) and that the facilities can disposed of as sanitary waste. This section of the RLC Report (RLCR) presents data quality objectives (DQOs) used, historical and process knowledge, and RLC performed to release the facilities. Section 3.0 also describes the survey units for characterizing the seven facilities, and defines the methods used to perform radiological surveys, scans and sampling. The RLC followed the guidance provided in NUREG-1575, the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM).

3.1 Data Quality Objectives

The following section revisits the original DQOs used in designing the RLC Characterization Package.

The Problem

The problem consists of the unknown volume of floors, walls, ceilings and roofing, interior/exterior to the facilities, and the unknown extent of radiological and chemical contamination on and in floors, walls (interior and exterior), ceilings and roofing.

The Decision

The decision is whether release criteria for radiological and chemical constituents have been met, based on types and quantities of any radiological and chemical contamination present.

Inputs to the Decision

The inputs to the decision include historical and process knowledge; data collected from this RLC; and release criteria and waste management regulations.

Decision Boundaries

The decision boundaries include the floors, walls (interior and exterior), ceilings, roofing and any fixed equipment associated with the seven facilities.

Decision Rules

This section presents the rules to support the characterization decisions, specific to each type of contamination.

Radionuclides

- If all radiological survey and scan measurements are below the surface contamination guidelines provided in DOE Order 5400.5 (Radiation Protection of the Public and Environment), the related surface is considered not radiologically contaminated.

- If any radiological survey or scan measurement exceeds the surface contamination guidelines provided in DOE Order 5400.5, the related survey unit must be evaluated per the statistical tests described in Section 7.0 of the RFETS Pre-Demolition Survey Plan.

Hazardous Waste

If decommissioning waste is mixed with or contains a listed hazardous waste, or if the waste exhibits a characteristic of a hazardous waste, then the waste is considered RCRA-regulated hazardous waste in accordance with 6 CCR 1007-3, Part 261 and 268.

Hazardous Substances

If material contains a listed hazardous substance the CERCLA reportable quantity (40 CFR 302.4), the material is subject to CERCLA regulation (i.e., notification requirements).

Beryllium

If surface concentrations of beryllium are equal to or greater than 0.2 $\mu g/100\ cm^2$, the material is considered beryllium contaminated per the Occupational Safety and Industrial Hygiene Program Manual, Chapter 28, Chronic Beryllium Disease Prevention Program (CBDPP).

Polychlorinated Biphenyls (PCBs)

- If material contains PCBs from the manufacturing process, the material is considered PCB Bulk Product Waste and subject to the requirements of 40 CFR 761.

- If PCB contamination from a past spill/release is suspected, or if a PCB spill is discovered that has not been cleaned up, the associated material is considered PCB Remediation Waste and subject to the requirements of 40 CFR 761, the RFETS Polychlorinated Biphenyls Management Plan (PRO-673-EWQA-1.5), and the RFETS WSRIC standards.

- If a waste or item contains PCBs in regulated concentrations, the waste or item is considered PCB-regulated material and subject to the requirements of 40 CFR 761.

Asbestos

If any one sample of a sample set representing a homogeneous medium results in a positive detection for asbestos (i.e., >1% by volume), then material is considered asbestos containing material (ACM; 40 CFR 763 and 5 CCR 1001-10).

Tolerable Limits on Decision Error

The maximum value for false positive and false negative errors is 5% when calculating the number of samples required.

Optimization of Plan Design

Radiological characterization was conducted on interior floors, walls and ceilings, and exterior walls and roofs as necessary. The following criteria were used to develop the radiological survey/sampling characterization package:

- Radiological field measurement methods and instrumentation are described in Section 6 of MARSSIM.
- Radiological sampling and preparation for laboratory measurements are described in Section 7 of MARSSIM.
- If radiological survey/samples are required for release, then radiological surveying and sampling are conducted per the requirements in the RFETS HSP 18.10, Radioactive Material Transfer and Unrestricted Release of Property and Waste.

If hazardous waste, hazardous substance, beryllium, PCB or asbestos surveys/samples are required, sampling and analysis are conducted in accordance with Section 6.0 of the D&D Characterization Protocol.

3.2 Radiological Characterization

Radiological characterization was performed to define the nature and extent of radioactive contamination that may be present on or in the seven facilities. This section reviews the historical radiological information on these facilities, or lack thereof, and discusses the RLC conducted. Radiological hazards are discussed in Section 4.0, and RLC data are presented in Appendices A - G.

3.2.1 Summary of Historical Information

Historically, radiological surveys for B331A, B987, T331A, T771D, T331, T750E and T903A may have been performed, but the data are not readily available. There are no Plant Action Tracking System items outstanding on these trailers, which indicates no

associated radiological program deficiencies. Trailers T331A and T771D are individually listed in I-P73-HSP-18.10, *Radioactive Material Transfer And Unrestricted Release Of Property And Waste, Appendix 4, Unrestricted Release Building/Facility List.* This listing authorizes the unrestricted release of administrative, non-hazardous property located in the trailers without radiological surveys or Radiological Safety signature for either off-site shipment or transfer to PU&D. The HSP 18.10 listing is indicative of structures with a low probability of radioactive contamination, based on historical activities associated with the facilities.

3.2.2 Summary of RLC Data Collected

Although historical review indicates no use of DOE-added radioactive material, insufficient quantitative radiological data existed to designate B331A, B987, T331A, T771D, T331 and T750E as non-impacted pursuant to MARSSIM. T903A is considered an impacted facility per MARSSIM. Therefore, radiological surveys and scans were performed in all facilities (refer to RLC Package for Group C Trailers, Integrated Work Control Package (IWCP) Work Control No. T0102832; K-H 2000a). An interior and exterior survey unit was designated for T331A, T331, T750E, T771D and T903A. The interior and exterior were combined as a single survey unit for B331A and B987.

Total surface activity (TSA), removable activity, and surface scans were performed on the interior and exterior of all facilities for alpha and beta contamination per MARSSIM guidance. Surface scans were performed in areas where contamination would be expected to accumulate (i.e., high traffic areas on the floors, etc.). A minimum of 10% of the total area of the survey unit was scanned for all facilities except T903A. 100% of the floor area within T903A was scanned. Twenty-eight randomly selected TSA and removable activity measurements were taken in each survey unit except the interior of T903A. A systematic grid pattern was used for the 28 measurement points on the interior of T903A in accordance with MARSSIM requirements for Class 2 facilities. TSA and removable activity measurements were taken independently of surface scans to maximize the probability of finding contamination. Five of the twenty-eight randomly selected TSA measurement locations were resurveyed by an independent radiological control technician for quality control (QC) purposes. In addition, 5% of the 10% surface scan area was resurveyed for QC purposes.

In general, two roof media samples and a duplicate (three samples total) were analyzed for each facility that had elevated readings to determine if elevated radioactivity was due to naturally occurring radioactive material (NORM), specifically Po-210 (Polonium). Facilities that had no elevated readings were not sampled. Sampling requirements are delineated in the Characterization Package for Sampling and Analysis of Roofing Material from Groups B & C for Isotopic Analysis, March 16, 2000 (K-H 2000b). The characterization strategy was designed to acquire a statistically valid number of samples for a specific media type generic to both Group B and C trailers, which routinely yields elevated total surface activity values. The specific media type of interest was weathered sheet metal, in the form of exterior (trailer) roofs. The strategy also

considered results from 15 additional samples acquired from a similar trailer roof, specifically from Trailer 112B. Based on the favorable results from T112B (which both ruled-out DOE-added material and confirmed Po-210 as the cause of elevated TSAs), the sample frequency for Group B and C trailers (cited above) was chosen for each trailer roof to produce a total of 26 samples (not including duplicates) to represent the trailer roofs as one population.

Ventilation systems in trailers and the underneath of trailers were not specifically measured for contamination. No ventilation system contamination was suspected by Safety and Industrial Hygiene, and the trailers had been cleared for occupation until abandoned. Also, exterior and interior measurements were used as an indicator for other contamination, including ventilation system contamination. In addition, radiological contamination resulting from windblown dispersion is just as likely a mechanism for contamination as actual contact with soil at grade, therefore, interior and exterior surveys conducted were adequate.

3.2.3 Sampling and Field Measurement Methods, Procedures and Equipment

TSA measurements for alpha and beta were taken with a NE Electra using a DP-6 probe. Removable activity measurements for alpha and beta were analyzed with an Eberline SAC-4 and BC-4, respectively. Surface scans for alpha and beta were taken with the NE Electra at a scan rate of 1.5 inches per second and 4 inches/second, respectively. Radiological survey packages were developed for each survey unit in accordance with RFETS Radiological Safety Practices (RSP) 16.01, "Radiological Survey/Sampling Package Design, Preparation, Control, Implementation and Closure," RFETS RSP 16.02, "Radiological Surveys of Surfaces and Structures" and RFETS RSP 16.05, "Radiological Survey/Sample Quality Control." Radiological surveys and scans were taken per the requirements of Appendix 8 of RFETS SWP-RFCSS-00002-00, "Reconnaissance Level Characterization", Revision 0, dated February 2000.

Specific TSA and removable survey locations were selected using a random number generator for all facilities except T903A. For T903A, one point of the grid pattern selected was randomly placed. Since all points in T903A could not be placed using the grid, one point was chosen on a random basis to complete the survey grid design. Scan locations were biased toward heavy foot-traffic areas and areas likely to collect airborne particulates. Random measurements were taken at the center of each grid location. If grid locations were inaccessible, the measurement was obtained as close as possible to the grid location, and the new location was annotated on the survey map.

Measurement locations were clearly identified with labels or permanent markings to provide a method of referencing survey results to survey measurement locations. These measurement locations were incorporated into a grid map at survey densities of 1 m^2. Measurement results as well as statistical data analyses are presented in the appendix for each survey unit.

23

Roof media sampling requirements are delineated in the Characterization Package for Sampling and Analysis of Roofing Material from Groups B & C for Isotopic Analysis, March 16, 2000.

Samples were managed to ensure an accurate record of sample collection, transport, analysis, and disposal. Chain-of-custody documentation captures this process for all samples submitted for laboratory analysis and ensures that samples are neither lost nor tampered with and that the samples analyzed are traceable to a specific location in the field. Chain-of-custody forms are included as part of survey documentation in Appendix H.

3.2.4 Laboratory Analysis

Radiological samples were analyzed using the Oxford Alpha Spectroscopy Integrated System (OASIS). Radiological samples used to verify and validate OASIS results were analyzed in accordance with Analytical Services Division contractual requirements, specifically Module RCO1, *Isotopic Determinations by Alpha Spectroscopy.*

All samples collected for RFETS laboratories or approved contracted laboratories were analyzed via a Site-approved method (see Section 6.2.3). The laboratories have an established quality assurance/quality control program that assures the validity of the analytical results. The laboratory analytical methods used are capable of measuring levels at or below 50% of the established release criteria. All results state the detection limit for the analysis. Results are detailed in the Appendices for each individual survey unit.

3.3 Chemical Characterization

Chemical characterization was performed to determine the nature and extent of chemical contamination that may be present on or in the seven facilities (B331A, B987, T331A, T771D, T331, T750E and T903A). Characterization was based on a review of historical and process knowledge and visual inspections, and is presented in this section. Related hazards are discussed in Section 4.0.

3.3.1 Summary of Historical Information

Information on contaminants of concern (i.e., asbestos, beryllium, RCRACERCLA constituents, lead in paint, and PCBs) is presented below.

Asbestos: No historical asbestos inspection data exist for any of the Group C facilities. Therefore, an asbestos inspection was required for RLC.

Beryllium: There is no record of beryllium operations or storage being conducted in the Group C facilities (refer to *D&D Facility Characterization Interview Checklist and Type I Facility Checklist for Group C Facilities,* and *List of Known Beryllium Areas*). Additionally, T771D has been used as administrative office space since its arrival on

site, and the *RFETS Administrative Equipment Characterization for Beryllium Contamination Project Plan Report* (January 1998) showed that administrative buildings with no record of beryllium activities had no detectable beryllium contamination. Therefore, beryllium sampling is unnecessary and was not conducted.

RCRA/CERCLA Constituents [including metals and volatile and semi-volatile organic compounds (VOCs & SVOCs)]: According to historical and process knowledge, the seven facilities were not used for operations involving hazardous chemicals (*D&D Facility Characterization Interview Checklist and Type I Facility Checklist for Group C Facilities*). B331A was used to store fire extinguishers, and B987 was used to store CS/CN gas cylinders and boxes of explosives. No releases/spills of hazardous substances are known to have occurred, and no hazardous wastes were generated or stored in these facilities. Therefore, sampling for chemical contaminants is unnecessary and was not conducted.

Lead in paint: No information exists on the lead content of paints on the Group C facilities. However, Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based Paint Debris Disposal*, states that LBP debris generated outside of high contamination areas shall be managed as non-hazardous (solid) wastes and need not be sampled unless the potentially lead-containing component is to be scabbled or otherwise comprise a separate waste stream. Therefore, analysis for lead in paint is not required for release.

Polychlorinated Biphenyls (PCBs): Historical data and process knowledge give no reason to suspect that any specialized paints or coatings containing PCBs were applied to the Group C facilities. However, Environmental Waste Compliance Guidance #25, *Management of Polychlorinated Biphenyls (PCBs) in Paint and Other Bulk Product Waste During Facility Disposition*, has directed that applied dried paints, varnishes, waxes, or other similar coatings or sealants are acceptable for disposal (with notification) in a non-hazardous solid waste landfill as PCB Bulk Product Waste under 40 CFR 761.3 and 40 CFR 761.62 paragraph (b), and therefore, need not be sampled as long as restrictions outlined in 40 CFR 761.62 regarding their disposition are met. Therefore, the Group C facilities do not require characterization for PCBs in paint.

Fluorescent light ballasts containing PCBs may exist in the Group C facilities due to their age. All PCB ballasts must be removed and segregated in a separate waste stream prior to disposition of the Group C facilities. Therefore, inspection of fluorescent light ballasts for PCBs was required for RLC.

3.3.2 Summary of RLC Data Collected

Based on historical information presented in Section 2.0 and the inspections conducted, the only RLC field activities required were sampling for asbestos-containing material and inspection of fluorescent light ballasts for PCBs. An asbestos inspection of the seven facilities was conducted by a CDPHE-certified asbestos inspector. Light ballasts

were evaluated by knowledge staff. A visual inspection of the facilities' roofs, interior and exterior panels, walls, and floors revealed no evidence of chemical spills or releases (i.e., stains, discoloration, odors, or other physical characteristics).

4.0 HAZARDS

This sections presents physical, radiological and chemical hazards by facility, including data from radiological field measurements and laboratory analysis. Data are presented in Appendixes A – G.

The RLC (serving also as the Pre-Demolition Survey, PDS) confirmed that the Group C Facilities (inside and outside) do not contain radiological contamination above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. The exterior survey units contained numerous total surface activity measurements above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. These results were suspected to be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. OASIS results validated the presence of Po-210 and the absence of DOE-added material.

For each trailer, the potential for a chemical hazard due to each of the following contaminants was considered:

- Asbestos.
- Beryllium;
- Lead and other metals;
- VOCs/SVOCs;
- PCBs.

Each potential chemical hazard was evaluated primarily based upon historical and process knowledge coupled with visual inspections (refer to Section 3.3). In addition, each facility was inspected for asbestos-containing material (ACM) and chemical spills, including PCB leaks from PCB light ballasts. Some samples were taken and analyzed for ACM. The chemical hazards are summarized in Table 4-1.

4.1 B331A

4.1.1 Physical Hazards

The structure presents no special physical hazards. B331A is structurally in good condition and is empty of any hazardous equipment. Current physical hazards associated with the structure consist of those common to an empty structure. The structure is not connected to any utilities such as electricity. Physical hazards are controlled by the Site Safety and Industrial Hygiene Program, which is based on OSHA regulations and standard industry practices.

Table 4-1 Summary of Group C Chemical Hazards

Contaminant of Concern	Analysis	Historical or RLC?	Below release limit or regulatory thresholds?
Asbestos	Two samples of T750E brown sheet linoleum were determined to contain asbestos.	RLC	Yes[1]
	Flooring beneath the carpet in T331A was determined to contain asbestos.	RLC	Yes[1]
	The roof of B987 is transite and was assumed to contain asbestos.	RLC	Yes[1]
	Walls and roof of B331A are transite and assumed to contain asbestos.	RLC	Yes[1]
Metals, including Be	No history of use or storage. No sampling is required.	Historical	Yes
VOCs/SVOCs	No history of use or storage. No sampling was required.	Historical	Yes
Lead in paint	No sampling is required.	Historical	Yes[2]
PCBs	All PCB ballasts have been removed. No specialized paints or coatings were observed. No sampling for PCB in paint was required.	Historical	Yes[3]

1 Notification of the State and of the waste disposal facility of the presence of non-friable asbestos is required if remediation is not carried out prior to disposal.

2 Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based Paint Debris Disposal*, states that LBP debris generated outside of currently identified high contamination areas shall be managed as non-hazardous (solid) wastes and need not be sampled unless the potentially lead-containing component is to be scabbled or otherwise comprise a separate waste stream.

3 Environmental Waste Compliance Guidance #25, *Management of Polychlorinated Biphenyls (PCBs) in Paint and Other Bulk Product Waste During Facility Disposition*, states that applied dried paints, varnishes, waxes, or other similar coatings or sealants are acceptable for disposal (with notification) in a non-hazardous solid waste landfill as PCB Bulk Product Waste under 40 CFR 761.3 and 40 CFR 761.62 paragraph (b) and therefore need not be sampled as long as restrictions outlined in 40 CFR 761.62 regarding their disposal are met.

4.1.2 Radiological Hazards

Based on historical and process knowledge, B331A is classified as a MARSSIM Class 3 area and a Type I facility pursuant to the DPP. The RLC (serving also as the PDS) confirms that this trailer does not contain radiological contamination above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual.

B331A, because of its small size, was a combined interior/exterior survey unit. The interior of the building contained no measurements (TSA or Removable Activity) above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. The exterior of the building contained one alpha TSA measurement above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. This result was suspected to be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. Data are presented in Appendix A.

B331A was not included in the characterization package to be sampled. However, because of the similar nature of the roof surface to the trailers that were sampled in Groups B and C, it can be inferred that the elevated reading is due to the presence of Po-210 and not DOE-added material.

4.1.3 Chemical Hazards

4.1.3.1 Asbestos

No historical asbestos data were available for B331A, so an asbestos inspection was performed as part of RLC. Because B331A is being released as waste, material potentially containing *friable* or *non-friable* asbestos was required to be sampled.

B331A walls and roof contain transite, which is assumed to be asbestos-containing without sampling, as determined by a CDPHE-certified asbestos inspector. If related ACM remediation is not performed prior to release, notification of the State and the waste disposal facility of the presence of asbestos is required. No hazard from *friable* asbestos exists on the facility. The asbestos data are contained in Appendix A-2.

4.1.3.2 Metals (including beryllium and lead in paint)

According to historical and process knowledge, no metals, including beryllium and lead, were used or stored in the facility, and therefore, no related hazards are present on building walls and roofing.

4.1.3.3 VOCs/SVOCs

According to historical and process knowledge, no chemicals were used or stored in the facility (except chemicals contained in fire extinguishers), and therefore, no related hazards are present on building walls and roofing.

4.1.3.4 PCBs

There is no record of PCB product use or storage in B331A, and therefore, no related hazards are present on building walls and roofing.

4.2 B987

No hazards are associated with B987 except the transite roof. The building slab will remain in place after the building is removed. This slab will be further characterized prior to and during its removal.

4.2.1 Physical Hazards

The structure presents no special physical hazards. B987 is structurally in good condition and is empty of any hazardous equipment. Current physical hazards associated with the structure consist of those common to an empty structure. The structure is still connected to Site electricity. Physical hazards are controlled by the Site Safety and Industrial Hygiene Program, which is based on OSHA regulations and standard industry practices.

4.2.2 Radiological Hazards

Based on historical and process knowledge, B987 was classified as a MARSSIM Class 3 area and a Type I facility pursuant to the DPP. The RLC (serving also as the PDS) confirms that this trailer does not contain radiological contamination above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual.

B987, because of its small size, was a combined interior/exterior survey unit. The interior of the building contained no measurements (TSA or Removable Activity) above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. The exterior of the building contained two alpha TSA measurements between 75 and 100% of the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. These results were suspected to be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. Data are presented in Appendix B.

Nine point investigations for TSA, over a 1 m^2 area, were performed at each of the two elevated locations. In both cases the average over the 1 m^2 area was less than 75 dpm/100 cm^2.

4.2.3 Chemical Hazards

4.2.3.1 Asbestos

30

No historical asbestos data were available for B987, so an asbestos inspection was performed as part of RLC. Since B987 is being released as waste, material potentially containing *friable* or *non-friable* asbestos was required to be inspected.

B987 has a corrugated transite roof, which is assumed to be asbestos-containing without sampling, as determined by a CDPHE-certified asbestos inspector. If related ACM remediation is not performed prior to release, notification of the State and the waste disposal facility of the presence of asbestos is required. No hazard from *friable* asbestos exists on the facility. The asbestos data are contained in Appendix B-2.

4.2.3.2 Metals (including beryllium and lead in paint)

According to historical and process knowledge, no metals, including beryllium and lead, were used or stored in the facility, and therefore, no related hazards are present on building walls and roofing.

4.2.3.3 VOCs/SVOCs

B987 was used to store CS/CN gas cylinders and boxes of explosives, however, no releases of gas and explosives are known to have occurred. According to historical and process knowledge, no other chemicals were used or stored in the facility, and therefore, no related hazards are present on building walls and roofing.

4.2.3.4 PCBs

There is no record of PCB product use or storage in B987, and therefore, no related hazards are present on building walls and roofing.

4.3 T331A

4.3.1 Physical Hazards

The trailer presents no special physical hazards. T331A is structurally in good condition and is empty of any hazardous equipment. Current physical hazards associated with the trailer consist of those common to an empty trailer. The trailer is still connected to Site electricity. Physical hazards are controlled by the Site Safety and Industrial Hygiene Program, which is based on OSHA regulations and standard industry practices. The trailer, however, has been condemned because of mold contamination.

4.3.2 Radiological Hazards

Based on historical and process knowledge, Trailer T3311A is classified as a MARSSIM Class 3 area and a Type I facility pursuant to the DPP. The RLC (serving also as the PDS) confirms that this trailer does not contain radiological contamination above the

release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual.

Trailer T331A was separated into two distinct survey units: Interior and Exterior. The Interior survey unit contained no measurements (TSA or Removable Activity) above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. The Exterior survey unit contained nine alpha TSA measurements above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. These results were suspected to be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. OASIS results indicated the presence of Po-210 and the absence of DOE-added material. Data are presented in Appendix C.

4.3.3 Chemical Hazards

4.3.3.1 Asbestos

No historical asbestos data were available for T331A, so an asbestos inspection was performed as part of RLC. Since T331A is being released as waste, material potentially containing *friable* or *non-friable* asbestos was required to be sampled.

Samples from the flooring material that runs throughout the trailer beneath the carpet were determined by a CDPHE-certified asbestos inspector to be asbestos-containing. If related ACM remediation is not performed prior to release, notification of the State and the waste disposal facility of the presence of asbestos is required. No hazard from *friable* asbestos exists on the facility. The asbestos data are contained in Appendix C-3.

4.3.3.2 Metals (including beryllium and lead in paint)

According to historical and process knowledge, no metals, including beryllium, were used or stored in the facility, and therefore, no related hazards are present.

The paint on the interior and exterior surfaces of T331A has not been characterized for lead in paint. Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based Paint Debris Disposal*, states that LBP debris generated outside of high contamination areas shall be managed as non-hazardous (solid) wastes and need not be sampled unless the potentially lead-containing component is to be scabbled or otherwise comprise a separate waste stream.

4.3.3.3 VOCs/SVOCs

According to historical and process knowledge, no chemicals were used or stored in the facility, and therefore, no related hazards are present.

4.3.3.4 PCBs

All fluorescent light ballasts have been removed. There is no record of PCB product use or storage in T331A, and therefore, no related hazards are present.

4.4 T771D

4.4.1 Physical Hazards

T771D is structurally in poor condition. Hazards associated with the disposition of such a trailer will need to be assessed prior to disposition, and controls to protect workers will need to be established and implemented. The trailer is empty of any hazardous equipment, and is not connected to any utilities such as Site electricity. Physical hazards are controlled by the Site Safety and Industrial Hygiene Program, which is based on OSHA regulations and standard industry practices.

4.4.2 Radiological Hazards

Based on historical and process knowledge, Trailer T771D is classified as a MARSSIM Class 3 area and a Type I facility pursuant to the DPP. The RLC (serving also as the PDS) confirms that this trailer does not contain radiological contamination above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual.

Trailer T771D was separated into two distinct survey units: Interior and Exterior. The Interior survey unit contained no measurements (Total Surface Activity or Removable Activity) above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. The Exterior survey unit contained ten alpha Total Surface Activity measurements above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. These results were suspected to be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. OASIS results indicated the presence of Po-210 and the absence of DOE-added material. Data are presented in Appendix D.

4.4.3 Chemical Hazards

4.4.3.1 Asbestos

No historical asbestos data were available for T771D, so an asbestos inspection was performed as part of RLC. Since T711D is being released as waste, material potentially containing *friable* or *non-friable* asbestos was required to be inspected.
T771D has wooden ceiling panels, and the walls are insulated by fiberglass. No potentially asbestos-containing material was observed during an inspection by a CDPHE-certified asbestos inspector. No sampling was required. The asbestos data are contained in Appendix D-3.

4.4.3.2 Metals (including beryllium and lead in paint)

According to historical and process knowledge, no metals, including beryllium, were used or stored in the facility, and therefore, no related hazards are present.

The paint on the interior and exterior surfaces of T771D has not been characterized for lead in paint. Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based Paint Debris Disposal*, states that LBP debris generated outside of high contamination areas shall be managed as non-hazardous (solid) wastes and need not be sampled unless the potentially lead-containing component is to be scabbled or otherwise comprise a separate waste stream.

4.4.3.3 VOCs/SVOCs

According to historical and process knowledge, no chemicals were used or stored in the facility, and therefore, no related hazards are present.

4.4.3.4 PCBs

All fluorescent light ballasts have been removed. There is no record of PCB product use or storage in T771D, and therefore, no related hazards are present.

4.5 T331

4.5.1 Physical Hazards

T331 is structurally in poor condition. Hazards associated with the disposition of such a trailer will need to be assessed prior to disposition, and controls to protect workers will need to be established and implemented. The trailer is empty of any hazardous equipment, and is not connected to any utilities such as Site electricity. Physical hazards are controlled by the Site Safety and Industrial Hygiene Program, which is based on OSHA regulations and standard industry practices.

4.5.2 Radiological Hazards

Based on historical and process knowledge, Trailer T331 is classified as a MARSSIM Class 3 area and a Type I facility pursuant to the DPP. The RLC (serving also as the PDS) confirms that this trailer does not contain radiological contamination above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual.

Trailer T331 was separated into two distinct survey units: Interior and Exterior. The Interior survey unit contained no measurements (Total Surface Activity or Removable Activity) above the release limits prescribed in DOE Order 5400.5 and the RFETS

Radiological Control Manual. The Exterior survey unit contained one alpha Total Surface Activity measurement above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. This result was suspected to be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. OASIS results indicated the presence of Po-210 and the absence of DOE-added material. Data are presented in Appendix E.

4.5.3 Chemical Hazards

4.5.3.1 Asbestos

No historical asbestos data were available for T331, so an asbestos inspection was performed as part of RLC. Since T331 is being released as waste, material potentially containing *friable* or *non-friable* asbestos was required to be inspected.

No potentially asbestos-containing material was observed during an inspection by a CDPHE-certified asbestos inspector. No sampling was required. The asbestos data are contained in Appendix E-3.

4.5.3.2 Metals (including beryllium and lead in paint)

According to historical and process knowledge, no metals, including beryllium, were used or stored in the facility, and therefore, no related hazards are present.

The paint on the interior and exterior surfaces of T331 has not been characterized for lead in paint. Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based Paint Debris Disposal*, states that LBP debris generated outside of high contamination areas shall be managed as non-hazardous (solid) wastes and need not be sampled unless the potentially lead-containing component is to be scabbled or otherwise comprise a separate waste stream.

4.5.3.3 VOCs/SVOCs

According to historical and process knowledge, no chemicals were used or stored in the facility, and therefore, no related hazards are present.

4.5.3.4 PCBs

All fluorescent light ballasts have been removed. There is no record of PCB product use or storage in T331, and therefore, no related hazards are present.

4.6 T750E

4.6.1 Physical Hazards

T750E is structurally in poor condition. Hazards associated with the disposition of such a trailer will need to be assessed prior to disposition, and controls to protect workers will need to be established and implemented. The trailer is empty of any hazardous equipment, and is not connected to any utilities such as Site electricity. Physical hazards are controlled by the Site Safety and Industrial Hygiene Program, which is based on OSHA regulations and standard industry practices.

4.6.2 Radiological Hazards

Based on historical and process knowledge, Trailer T750E is classified as a MARSSIM Class 3 area and a Type I facility pursuant to the DPP. The RLC (serving also as the PDS) confirms that this trailer does not contain radiological contamination above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual.

Trailer T750E was separated into two distinct survey units: Interior and Exterior. The Interior survey unit contained no measurements (Total Surface Activity or Removable Activity) above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. The Exterior survey unit contained ten alpha Total Surface Activity measurements above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. These results were suspected to be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. OASIS results indicated the presence of Po-210 and the absence of DOE-added material. Data are presented in Appendix F.

4.6.3 Chemical Hazards

4.6.3.1 Asbestos

No historical asbestos data were available for T750E, so an asbestos inspection was performed as part of RLC. Since T750E is being released as waste, material potentially containing *friable* or *non-friable* asbestos was required to be inspected.

Two samples each were taken of the brown sheet linoleum on the floor and the 2' x 4' white ceiling tiles. Three samples were taken of the drywall, which contained no tape joint compound. Samples were taken during an inspection by a CDPHE-certified asbestos inspector.

Both samples of the brown sheet linoleum were determined to be asbestos containing. No hazard from *friable* asbestos exists on the trailer. If related ACM remediation is not performed prior to release, notification of the State and of the waste disposal facility of the presence of asbestos is required. The asbestos data are contained in Appendix F-3.

4.6.3.2 Metals (including beryllium and lead in paint)

According to historical and process knowledge, no metals, including beryllium, were used or stored in the facility, and therefore, no related hazards are present.

The paint on the interior and exterior surfaces of T750E has not been characterized for lead in paint. Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based Paint Debris Disposal*, states that LBP debris generated outside of high contamination areas shall be managed as non-hazardous (solid) wastes and need not be sampled unless the potentially lead-containing component is to be scabbled or otherwise comprise a separate waste stream.

4.6.3.3 VOCs/SVOCs

According to historical and process knowledge, no chemicals were used or stored in the facility, and therefore, no related hazards are present.

4.6.3.4 PCBs

All fluorescent light ballasts have been removed. There is no record of PCB product use or storage in T750E, and therefore, no related hazards are present.

4.7 T903A

4.7.1 Physical Hazards

T903A is structurally in poor condition. Hazards associated with the disposition of such a trailer will need to be assessed prior to disposition, and controls to protect workers will need to be established and implemented. The trailer is empty of any hazardous equipment, and is not connected to any utilities such as Site electricity. Physical hazards are controlled by the Site Safety and Industrial Hygiene Program, which is based on OSHA regulations and standard industry practices.

4.7.2 Radiological Hazards

Based on historical and process knowledge, Trailer T903A is classified as a MARSSIM Class 3 area and a Type I facility (exterior), and a MARSSIM Class 2 area and a Type I facility (interior) pursuant to the DPP. The RLC (serving also as the PDS) confirms that this trailer does not contain radiological contamination above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual.

Trailer T903A was separated into two distinct survey units: Interior and Exterior. The Interior survey unit contained no measurements (Total Surface Activity or Removable Activity) above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. The Exterior survey unit contained nine alpha Total Surface Activity measurements above the release limits prescribed in DOE Order 5400.5 and the RFETS Radiological Control Manual. These results were suspected to

be elevated due to naturally occurring radioactive material (NORM), specifically Po-210, deposited on the roof surface. OASIS results indicated the presence of Po-210 and the absence of DOE-added material. Data are presented in Appendix G.

4.7.3 Chemical Hazards

4.7.3.1 Asbestos

No historical asbestos data were available for T903A, so an asbestos inspection was performed as part of RLC. Since T903A is being released as waste, material potentially containing *friable* or *non-friable* asbestos was required to be inspected.

Two samples were taken of the 12' x 12' white floor tile (with yellow / brown mastic) beneath the carpet. Two additional samples were taken of the green sheet tile (with black mastic) beneath the carpet. Samples were taken during an inspection by a CDPHE-certified asbestos inspector. None of these were determined to be asbestos containing. The asbestos data are contained in Appendix G-3.

4.7.3.2 Metals (including beryllium and lead in paint)

According to historical and process knowledge, no metals, including beryllium, were used or stored in the facility, and therefore, no related hazards are present.

The paint on the interior and exterior surfaces of T903A has not been characterized for lead in paint. Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based Paint Debris Disposal*, states that LBP debris generated outside of high contamination areas shall be managed as non-hazardous (solid) wastes and need not be sampled unless the potentially lead-containing component is to be scabbled or otherwise comprise a separate waste stream.

4.7.3.3 VOCs/SVOCs

According to historical and process knowledge, no chemicals were used or stored in the facility, and therefore, no related hazards are present.

4.7.3.4 PCBs

All fluorescent light ballasts have been removed. There is no record of PCB product use or storage in T903A, and therefore, no related hazards are present.

5.0 DECOMMISSIONING WASTE TYPES AND VOLUME ESTIMATES

The demolition and disposal of the seven Group C facilities will generate a variety of wastes. Table 5-1 presents the estimated volumes by facility and waste type. All wastes can be disposed of as sanitary waste. There will be no radioactive or hazardous waste. Some of the waste will be asbestos containing material (ACM). Disposal of ACM will require notification of the State and the waste disposal facility.

Table 5-1 Estimated Group C Waste Volumes by Waste Type and Facility

Facility	Concrete	Wood	Metal	Corrugated/ Sheet Metal	Wall Board	ACM	Other Waste
B331A	None	None	6 cu ft	32 cu ft	None	Transite walls - 32 cu ft	None
B987	200 cu ft	2 cu ft	12 cu ft	None	None	Transite roof - 5 cu ft	Glass brick - 2 cu ft
T331A	None	250 cu ft	85 cu ft	24 cu ft	16 cu ft	Flooring material – 8 cu ft	Fiberglass insulation - 400 cu ft, 1 hot water heater, 1 toilet, 1 sink
T771D	None	250 cu ft	80 cu ft	24 cu ft	16 cu ft	None	Fiberglass insulation - 400 cu ft, 1 gas furnace
T331	None	125 cu ft	50 cu ft	12 cu ft	16 cu ft	None	Fiberglass insulation - 200 cu ft, 1 heat pump, HVAC unit
T750E	None	125 cu ft	50 cu ft	12 cu ft	40 cu ft	Linoleum tile – 8 cu ft	Fiberglass insulation - 200 cu ft, 1 hot water heater, 1 heat pump, HVAC unit, 1 sink
T903A	None	240 cu ft	80 cu ft	24 cu ft	16 cu ft	None	Fiberglass insulation - 400 cu ft, 1 gas furnace

6.0 DATA QUALITY ASSESSMENT (DQA)

Data used in making decisions must be of adequate quality, as required by applicable K-H corporate policies (K-H QAPD, 1997, Section 7.1.4 and 7.2.2), as well as by the customer (DOE, RFFO; Order O 414.1A, Quality Assurance, §4.b.(2)(b)). Regulators and the public also expect decisions and data that are technically and legally defensible. Verification and validation of the data ensure that data used in decisions resulting from the RLC are usable and defensible.

The DQA consists of revisiting the DQOs used for the project and determining whether those objectives were met. This data evaluation also consists of verifying and validating the RLC data, which ensures that data input into decisions are accurate, precise, representative, complete, and comparable.

Original DQOs of the project are stated in Section 3.1, where problems, decisions, decision inputs, project boundaries, and error tolerances were adequately defined. The decision for the Group C facilities is whether contamination levels are below release criteria, for both chemicals and radionuclides. Although asbestos was detected in some of the floor tiles, it was not friable, and thus an asbestos hazard does not exist. No evidence of chemicals were noted (e.g., stains or fluorescent light ballasts with PCBs). The conclusions with respect to radiological contamination – all facilities comply with unrestricted release criteria -- are derived from measurements at a 95% confidence level, using MARSSIM methodology in the survey units' design. Original estimates of survey quantities were confirmed by using measured values (vs. assumed values) in the sample quantity derivation (Appendix H).

The RLC for Group C facilities was conducted in accordance with the FDPM and the DDCP. These programs conform with the Site's DOE-approved QA Program, which in turn conforms with DOE Order 414.1A, *Quality Assurance*. The program also conforms with MARSSIM guidance, which reflects elements of DOE Order 414.1A. Adequate implementation of the quality elements required by DOE Quality Assurance was corroborated through the verification and validation process described within this section.

The DQA presented in this section supports conclusions through implementation of the guidelines taken from the following MARSSIM sections:

- Section 4.9, Quality Control
- Section 8.2, Data Quality Assessment
- Section 9.0, Quality Assurance & Quality Control
- Appendix E, Assessment Phase of the Data Life Cycle
- Appendix N, Data Validation using Data Descriptors

The MARSSIM-recommended criteria for verification and validation of pre-demolition (final status) survey data, listed above, are summarized in Table 6-1. The MARRSIM criteria are listed across the top of the table, whereas the project's proof of

= qualified; some alpha spec (OASIS) sensitivities were between the DCGLw and 1/2 DCGLw due to relatively shorter count times; technique is semi-quantitative

Table 6-1 Group C Final Status Survey Compliance with MARSSIM Data Quality Guidelines.

implementation is listed along the left side of the table. One or more "checks" per column exhibit compliance with the MARSSIM criterion.

6.1 Verification Of Results

Verification ensures that data produced and used by the project are documented and traceable per quality requirements. Verification confirmed that:

- Chain-of-custody was intact from initial sampling though transport and final analysis;
- Preservation and hold-times were within tolerance;
- Format and content of the data are clearly presented relative to goals of the project.

Verification of the Group C dataset also confirmed the presence of records representing implementation of the following quality controls:

- Calibrations/periodic performance checks (alpha spectroscopy, surveys and scans), for accuracy;
- Laboratory control samples (LCS -- alpha spectroscopy), for accuracy;
- Blanks (alpha spectroscopy), for accuracy;
- Lab and field duplicate measurements, for precision;
- Chemical yield (alpha spectroscopy), for accuracy;
- Count times (alpha spectroscopy surveys and scans), for sensitivity;
- Sample preparations (alpha spectroscopy), for accuracy, representativeness.

Upon completion of the data management activities listed above, peer and quality assurance reviews were performed on the data and this, the final report.

In summary, the verification confirmed that documentation and quality records are intact for the project, which in turn corroborates implementation of the required technical quality controls and administrative requirements, particularly verification of those documents and records that will ultimately support the CERCLA Administrative Record. This report and all relevant Quality records associated with the project will be submitted to the CERCLA Administrative Record, for permanent storage, within 30 days of approval of the final report.

6.2 Validation Of Results

Validation consisted of a technical review of all data that directly support the RLC decisions. Any limitations of the data relative to project goals are delineated, and the associated data are qualified accordingly. Data were validated relative to quality criteria discussed throughout previously noted MARSSIM sections, RSP requirements, and PARCC parameters (Precision, Accuracy, Representativeness, Comparability, and Completeness). PARCC parameters are consistent with "data descriptors" in MARSSIM and address characteristics of the data that must be defined for scientific integrity and

42

defensibility. The PARCC parameters also include discussion on bias and sensitivity, two more data descriptors emphasized in MARSSIM.

Validation of the OASIS methodology was performed on four (4) samples representing the highest TSA values acquired in the field from both Group B and Group C facilities. Validation of the method consisted of 2 parts: 1) establishing presence/absence of DOE-added radionuclides at the sensitivities specified for the OASIS (i.e., ≤50% $DCGL_W$), and 2) quantification of Po-210 concentrations relative to levels measured in the field with hand-held instruments.

Most importantly, the offsite results (4 total) confirmed the absence of DOE-added radionuclides at the sensitivities cited for the OASIS. Of secondary interest were how well OASIS results for Po-210 levels corresponded with standard alpha spectroscopy that includes wet chemistry sample preparations (K-H Module RC01). A total of four replicate samples were submitted for analysis. The offsite lab yielded two (2) results with excellent agreement between methods (<5% difference), whereas two (2) other results reflect a potential high bias in the OASIS method (58% - 195% greater than offsite results for Po-210). A high bias is conservative with respect to unrestricted release decisions, and does not impact decisions made on this project.

6.2.1 Precision

6.2.1.1 Radiological Surveys and Scans

Precision of the radiological instrumentation was satisfactory based on tolerance charting of daily source measurements for each individual sensor used on the project, which includes all measurement types (scans and static measures for total contamination and swipes for removable). Adequate precision was established through instrument performance within a ±20% range as defined by measurement results compared to a standard source value. Based on site protocol (i.e., RSPs), any measurement exceeding the defined tolerance limits required corrective action (repair or replacement) prior to the instrument's use during pre-demolition survey.

Duplicate measurements were acquired for total and removable surface activity measurements at ≥10% frequency per survey unit. All duplicate measurements were within tolerance based on the acceptance criterion that both results be below Derived Concentration Guideline Level-Averaged Measures ($DCGL_W$). Note that even if populations were "significantly" different between real and duplicate results, if both duplicate and real population statistics are less than action levels, the difference between duplicate and real values is, ultimately, insignificant relative to release decisions.

6.2.1.2 Alpha Spectroscopy

Media samples were analyzed for the presence/absence of DOE-added radionuclides through the use of the onsite OASIS. Acceptable precision of the system was proven

through the use of multiple analyses of a standard reference materials (^{237}Np) within acceptance limits as established through control charting. Acceptable precision (repeatability) is exhibited through multiple measurements consistently falling within ±3 standard deviations (i.e., control limits) of an average value, typically illustrated through control charting.

Replicates of project samples, to determine overall sampling precision, were not analyzed through OASIS but were submitted to an offsite laboratory to better evaluate independent repeatability of the results (based on the relatively new application of OASIS in RFETS Pre-Demolition Surveys). Four (4) samples of the collective Group B and C sample sets, or ~10% of the collective, were submitted for duplicate analyses, consistent with industry standard quality control sampling frequency. The four samples were selected (biased) with respect to the highest TSA values measured by the OASIS on the trailers. Group B and C sample sets were combined for this evaluation of precision due to the similarity of material types (weathered sheet metals and tarry substrata), and locations (mobile trailer rooftop surfaces). Results indicate adequate repeatability and verify that the elevated alpha readings are due to Po-210 and not DOE-added material. Refer to Appendix G.

6.2.2 Accuracy (and Bias)

6.2.2.1 Radiological Surveys and Scans

Accuracy of radiological surveys and scans is satisfactory based on RFETS-programmatic annual calibrations that establish instrument efficiencies and sensitivities for all instrumentation used on this project. Daily source checks also provided periodic checks to ensure that all sensors are within tolerance during daily operations. Calibration and calibration check results were within the RFETS and industry-standard requirement of 20% of the applicable reference standard values. Full-scale, multi-point calibrations provided accuracy of ± 10% prior to implementation of survey instruments in the field, consistent with guidelines put forth in ANSI-N323A. Instrument calibration dates, operability checks, calculated MDA, and established background data are recorded and included in the RLC Data Package for Group C Facilities.

No significant biases were noted based on tolerance charting of all instrumentation used for scans and surveys. Any runs in the data, as defined by 7 or more consecutive points above or below the reference standard value, remained within the ±20% acceptable range of the reference value.

6.2.2.2 Alpha spectroscopy

Accuracies of the alpha spectroscopy results were acceptable based on establishing a batch-specific efficiency for the OASIS and measurement of reference standards within control limits (^{237}Np, as established by ±3 sigma bounds about the arithmetic mean).

44

Background values were approximately 1.2 dpm/100 cm^2 for the sample batches, which is typical for the OASIS. Background values approaching 2 dpm/100 cm^2 require corrective actions to the OASIS protocol, but this upper limit was not approached during analysis of the Groups B & C samples.

Preparation blanks were not required, as background values were established, and no wet chemistry sample preparations were necessary or performed. Potential cross-contamination of samples was not an issue, considering all transuranic results were below MDA and, of course, below the $DCGL_w$ as well. Uncertainties of the OASIS results, per sample, were quantified as ± 1 sigma error.

Verification and validation sample result accuracies from the offsite lab (GEL) were adequate based on satisfactory percent (tracer) yields and LCS recoveries between 80% and 120%. Random (counting) error was quantified as ± 2 sigma.

6.2.3 Representativeness

Samples, surveys and scans are representative based on the following criteria:

- Familiarity with facilities -- multiple walk-downs and collaborations by management and technical staff;
- Implementation of industry-standard chain-of-custody protocols;
- Compliance with sample preservation and hold times;
- Documented and (site) approved methods, particularly RSPs for scans/surveys and the following documents for alpha spectroscopy:
  - TBD-00143, *Direct Analysis of Alpha Emitters using the Oxford Alpha Spectroscopy Integrated System (OASIS)*
  - TBD-00153, *Use of the OASIS for Direct Differentiation between Po-210 and DOE-added Materials*; and
- Standard Work Package: SWP-RFCSS-00002-00, Revisions 0 and 1.0:
  - *Characterization Package for Sampling and Analysis of Roofing Material from Groups B & C for Isotopic Analysis*, March 16, 2000
  - IWCP Work Control No. T0102832
  - *Reconnaissance Level Characterization Package for Group C Trailers*, Feb. 2000, Rev. 0
  - IWCP Work Control No. T0102837
  - IWCP Work Control No. T0102838.

6.2.4 Completeness

The data set for this project is complete with respect to surveys, scans, samples and associated quality records ("data packages") resulting from the collective RLC and Pre-Demolition process. Based on process knowledge of the trailers, coupled with detailed visual inspections, chemical (non-radiological) analyses were not warranted for any of the Group C facilities. Completeness of radiological surveys and samples is detailed,

by individual survey unit, in each appendix. The complete and original data packages resulting from offsite labs are archived by K-H Analytical Services Division.

Consistent with the DQO process, the sampling design (for the minimum number of MARSSIM-based survey locations) was optimized through back-calculating actual measurement results (acquired during RLC) and comparing model output with original estimates (28, as noted on the "Survey Package Calculation Worksheet", Appendix H). Representative Post-Survey verification worksheets are included in Appendix H. Use of actual sample/survey/scan (result) variances in MARSSIM's DQO model provided confirmation that an adequate number of samples/surveys/scans had been acquired. In some instances, where TSA results were elevated due to Po-210 concentrations, the Post Survey calculations could indicate that more survey points were needed. These numbers are artificially high because the elevated results were due to Po-210, and not due to DOE-added radionuclides. Consequently, where the presence of NORM (specifically Po-210) was confirmed through alpha spec analysis, Post Survey Statistics Calculations that use survey (TSA) results are not applicable as a means of checking TSA survey frequencies, but would show adequate survey frequency if results attained from analytical samples were used instead.

6.2.5 Comparability

All results presented are comparable with radiological survey/scan and alpha spectroscopy data on a RFETS- and DOE-complex wide basis. This comparability is based on:

- Use of standardized engineering units in the reporting of measurement results;
- Consistent sensitivities of measurements at approximately 50% or less of the $DCGL_W$ (approximately 50% or less of the $DCGL_{EMC}$ for scans);
- Use of RFETS-approved procedures;
- Systematic quality controls; and
- Thorough documentation of the planning, sampling/analysis process, and data reduction into formats designed for making decisions based on the project's original DQOs.

6.2.6 Sensitivity

Adequate sensitivities, in units of dpm/100 cm^2, were attained for all surveys/scans and alpha spectroscopy methods implemented based on minimum detectable activities (MDAs) at 50% of the transuranic $DCGL_W$ ($\leq$ 50% $DCGL_{EMC}$ for scans), with the exception of 10 of the 18 samples analyzed by alpha spectroscopy. Limited count times were the cause of the elevated MDAs at 70 dpm/100cm^2, where the MARSSIM-recommended maximum sensitivity, in this case, would be at 50 dpm/100 cm^2. These MDAs do not affect final decisions based on the results of verification samples analyzed offsite, which verified the absence of DOE-added materials (Appendix H). In future RLC projects, all count times will comply with MARSSIM guidance.

The nominal MDAs for each survey and alpha spectroscopy method are summarized as follows:

- Removable alpha contamination (Eberline SAC-4): ≤10 dpm/100cm^2;
- Removable beta contamination (Eberline BC-4): <200 dpm/100cm^2;
- Total alpha contamination (NE Electra): <50 dpm/100cm^2;
- Total beta contamination (NE Electra): <350 dpm/100cm^2;
- Alpha spectroscopy (OASIS): 30 - 79 dpm/100cm^2 (cumulative transuranics – Am-241 and Pu-239/240).

6.2.7 Other QA Elements

All personnel performing activities affecting quality within the RLC project were qualified to perform their specific tasks. Suitable training and qualification documentation for personnel performing the work, from the laborers to technical professionals to management, is documented in both the IWCP and the applicable Human Resources department.

6.3 DQA Summary

In summary, the data presented in this report have been verified and are valid, with noted qualifications, and complete for comparison with release criteria (action levels) as stated in the DQOs. The qualifications listed for alpha spectroscopy data do not impact the decisions to release the structures/trailers. The results of verification samples from an offsite, independent laboratory (Appendix G) corroborated the absence of DOE-added radionuclides at the highest elevated TSA locations, and likewise confirmed that Po-210 was comparable to activities measured in the field with survey instrumentation and onsite alpha spectroscopy. All media sampled, surveyed and scanned relative to total and removable alpha activities yielded results less than release limits associated with the stated contaminants of concern. Therefore, the Group C facilities, both collectively and individually, meet the release criteria with the statistical and qualitative confidences stated in this section and throughout the report.

7.0 CLASSIFICATION OF TRAILERS

Based on the analysis of radiological, chemical and physical hazards, the Group C Facilities (B331A, B987, T331A, T771D, T331, T750E and T903A) are classified as Type I Facilities (i.e., "free of contamination") pursuant to the RFETS Decommissioning Program Plan (DPP, K-H, 1999). Classification was based on a review of historical and process knowledge, and newly acquired RLC data. Results indicate that no radioactive or chemical contamination exists and that no significant physical hazards are present. T331A, T750E, B331A and B987 contain non-friable ACM, and disposal of ACM will require notification of the State and the waste disposal facility.

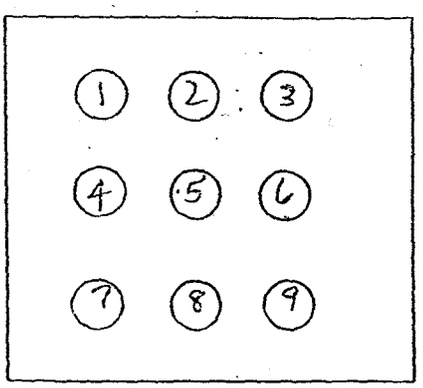
Final Survey NE Electra
Scan & Investigation Survey Map

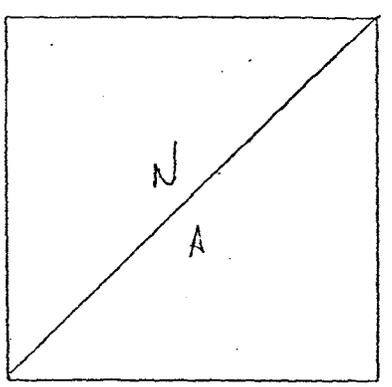
Survey Area: N/A	Survey Unit: EXTERIOR	Building: B331A
Survey Unit Description: 9-POINT INVESTIGATION		
RCT Initials/Date: [illegible]/3.11.00	RCT Initials/Date: N/A	RCT Initials/Date: N/A

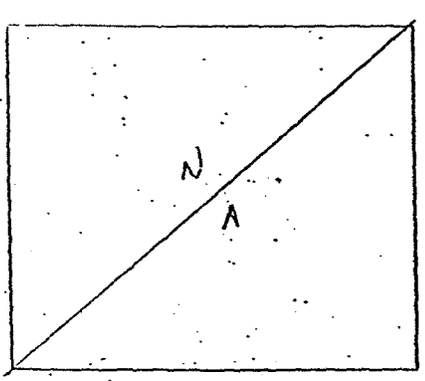
Refer to the Final Survey NE Electra Scan & Investigation Survey Form for instrumentation, surveyor & approval information.

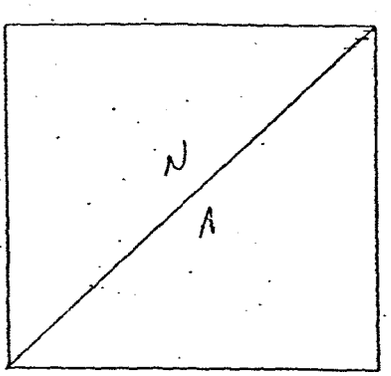
Legend: "R"- Roof, "W" – West Wall, "S" – South Wall, "E" – East Wall, "N" – North Wall "C" –Ceiling, "F" - Floor

D-2 R









*** Designates corner closest to A-1 point of reference**

Results/Comments:

Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm^2, unless noted on the survey form.

Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

B331A – Asbestos Inspector's Report

B331A

ASBESTOS INSPECTOR'S REPORT

I, the undersigned Certified Asbestos Inspector, certification # 1387 in the state of Colorado, attest to the asbestos inspection and sampling results as described below, for the following facility (at RFETS): Building 331A.

General Facility Location: north and adjacent to Building 335.

INSPECTION RESULTS
Portions of the walls consist of Transite® (based on visual inspection). Asbestos contained within the Transite is not in friable form, but could become friable if disintegrated.

SAMPLE RESULTS
None required; none taken.

Andre Gonzalez		7/12/00

D&D Facility Characterization Interview Checklist

Type 1 Facility Checklist

D&D Facility Characterization Interview Checklist

ID No.: B-331A
Date: 06/29/99

Groups B & C Series

Check List for - Title: D&D Facility Characterization – Interviews

CRITERIA: Λ *D&D Characterization Protocol*, RFETS MAN-077-DDCP, Rev. 0
Λ *Facility Disposition Program Manual*, RFETS MAN-076-FDPM
Λ RFETS Radiological Safety Practices, January 12, 1998

Facility Name & Type (1, 2, or 3) B-331A, Group B Type 1 Facility, Fire Station Storage and Training
Personnel Interviewed (Name & Title/Function) Timothy J. Parker, Fire Chief, X6043, P-212-3893, Building 331, Room 127, K-H RFETS Plant Fire Department

	– Y/N –
Does a current WSRIC exist for the facility?	N
If so, are there exceptions to the WSRIC as written?	No WSRIC, No Exceptions

COMMENTS (incl. WSRIC contacts)
WSRIC Contact is James M. Schoen who is in charge of the WSRIC Reports, T130J, X3579, C-83.

Are rad surveys available that indicate current status of the facility?	N
Are historical rad surveys available that indicate historical status, or evolution, of the facility?	N*

COMMENT N* According to Mark R. Richards, X5148 ~~of SSOC~~ any Historical data, which is probably at the Federal Center, would not be Adequate for unrestricted release or building demolition. New monitor surveys would have to be taken. JRS. 8/10/2000

Is an HRR available for the facility?	N
Do any other reports exist beyond the HRR (e.g., spill reports, reportable incidents, etc.) that further Characterize the facility relative to chemical &/or radiological contamination?	Y**
Are engineering drawings (esp. "as-builts") available?	N
Are any nonconformances or issues with the facility status currently being tracked in PATS?	N

If so, what are the issues (note in Comments, below)?
COMMENTS N* Radiological surveys may have been done, but the old data is not available. This unit will have to be resurveyed to meet present standards for unrestricted release or building demolition. Y** The Building 331A is sitting on three IHSSs, IHSS 134-North, IHSS 128, and IHSS 171 or PAC area land, as per, Nick Demos, ER Characterization/HRR Manager, X4605. Therefore, the Building 331A does not have CERCLA concerns, but the land it sits on does have CERCLA concerns. Engineering drawings, as-builts, are not available for Building 331. There are no PATS items outstanding for this facility. The Plant quit using lead based paints for office buildings in 1989, Building 331A is not an office building, if the facility was painted prior to 1989, lead based paints may have been used.

Have any types of chemical characterization, incl. Asbestos, been performed recently?	N*

If so, what types of characterization were performed (note in Comments, below)?
COMMENTS N* No asbestos characterization data exists, according to Kevin Sheehan, X7250, T-452D, Room C-1. The asbestos data reports are located in Cubicle C-13, of T-452D and the reports are under the control of Kevin Sheehan.

Interviewed by: J. R. Sheets / J R Sheets / 06/23/99
Print Name / Signature / Interview Date

D&D Facility Characterization Interview Checklist

ID No.: B-331A
Date: 06/29/99

Groups B & C Series

What timeframe did the interviewee work in the facility? N/A Building 331A has been used by the RFETS Plant Fire Station has used this facility for storage and training for approximately 35 years. Building 331A is totally empty and it has not been used for training or storage for approximately one year.

Has the building configuration changed since you worked in the building? If so, in what way? No,
What types of equipment were in the building during the interviewee's time there? When Building 331A was used, Fire Extinguishers were stored in the facility.

Where was the equipment located? (specific rooms/areas) Throughout the building the storage facility on the ground (the facility has no floor, only gravel and 3/4" rock).

Were any radioactive materials or metals handled in the building? If so, what types? No, none.

Which equipment handled radioactive material? N/A

Were any chemicals handled in the building? If so, what types? Yes, CO_2 Fire Extinguishers.

Did any spills or uncontrolled releases of radioactive materials or chemicals occur while you were working in the facility? Unknown

Were these spills/releases cleaned-up? How were they cleaned-up? N/A
Where did these spills/releases occur? N/A

Interviewed by: J. R. Sheets / J.R. Sheets / 06/23/99

Type 1 Facility Checklist

TYPE 1 FACILITY BUILDING B-331A

CURRENT LANDLORD: RFCSS

DATE OF COMPLETION: 02/29/00

ITEM	YES	NO
Does the facility contain radiological postings?		X
Does the facility contain chemical postings?		X
Are there any installed hazards?		X
Is there any information that indicates this facility was impacted by DOE chemical and/or radiological operations?		X
Are there RCRA units within the facility?		X
Is there a history of the building available?	X	
Is there any equipment/furniture left in the facility?		X
Is there a future mission identified for the facility?		X
Will the facility be left unsecured after it is vacated?		X

If any answer to any of the above questions is "Yes", complete the following questions and complete the "graded" PEP in accordance with Chapter 2.

Note: An answer of "Yes" to any question, specifically one dealing with hazards, ***may*** *indicate the facility is not a Type 1 Facility. Check with the D&D Programs office.*

If the answer to all question is "No" complete the "graded" PEP in accordance with Chapter 2.

1. List the Radiological Hazards, location, and quantity:

   Based on the historical data found and interviews taken there are no hazards in this building.

2. List the Chemical Hazards, location, and quantity:

   None. Based on historical data and interviews taken there are no chemical hazards in this building.

3. List the Physical Hazards:

   NONE

*** Designates corner closest to A-1 point of reference**

Results/Comments:
Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm^2, unless noted on the survey form.
Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

B987 – Asbestos Inspector's Report

B987

ASBESTOS INSPECTOR'S REPORT

I, the undersigned Certified Asbestos Inspector, certification # 1387 in the state of Colorado, attest to the asbestos inspection and sampling results as described below, for the following facility (at RFETS): Building 987.

General Facility Location: due west of Building 991, outside of protected area.

INSPECTION RESULTS

The roof consists of Transite®, based on visual inspection, and could become friable if disintegrated; the remainder of the building consists of cinder block construction.

SAMPLE RESULTS

None required; none taken.

D&D Facility Characterization Interview Checklist

Type 1 Facility Checklist

D&D Facility Characterization Interview Checklist

ID No.: B-987
Date: 06/09/99

Groups B & C Series

Check List for - Title: D&D Facility Characterization – Interviews

CRITERIA:
- Λ *D&D Characterization Protocol*, RFETS MAN-077-DDCP, Rev. 0
- Λ *Facility Disposition Program Manual*, RFETS MAN-076-FDPM
- Λ RFETS Radiological Safety Practices, January 12, 1998

Facility Name & Type (1, 2, or 3) B-987, Group C Type 1 Facility, Storage Vault (WSI Plant Protection)
Personnel Interviewed (Name & Title/Function) Lou C. Richmond, Team Lead Operations Services, X8361, P-212-6598, T-119B, Cubicle 72, WSLLC

	-- Y/N --
Does a current WSRIC exist for the facility?	N
If so, are there exceptions to the WSRIC as written?	No WSRIC, No Exceptions

COMMENTS (incl. WSRIC contacts)
WSRIC Contact is James M. Schoen who is in charge of the WSRIC Reports, T130J, X3579, C-83.

Are rad surveys available that indicate current status of the facility?	N
Are historical rad surveys available that indicate historical status, or evolution, of the facility?	N*

COMMENT N* According to Mark R. Richards, X5148 of ~~SSOC~~ any JRS 8/10/2000
Historical data, which is probably at the Federal Center, would not be Adequate for unrestricted release. New monitor surveys would have to be taken.

Is an HRR available for the facility?	N
Do any other reports exist beyond the HRR (e.g., spill reports, reportable incidents, etc.) that further Characterize the facility relative to chemical &/or radiological contamination?	Y**
Are engineering drawings (esp. "as-builts") available?	N
Are any nonconformances or issues with the facility status currently being tracked in PATS?	N

If so, what are the issues (note in Comments, below)?
COMMENTS N* Radiological surveys may have been done, but the old data is not available. This unit will have to be resurveyed to meet present standards for unrestricted release. Y** The Building 987 is not sitting on IHSS or PAC area land, as per, Nick Demos, ER Characterization/HRR Manager, X4605. Therefore, the Building 987 does not have CERCLA concerns. Engineering drawings, as-builts, do not exist for Building 987. There are no PATS items outstanding for this facility. The Plant quit using lead based paints for office buildings in 1989, Building 987 is a storage vault not an office building, if the facility was painted prior to 1989, lead based paints may have been used.

Have any types of chemical characterization, incl. Asbestos, been performed recently?	N*

If so, what types of characterization were performed (note in Comments, below)?
COMMENTS N* No asbestos characterization data exists, according to Kevin Sheehan, X7250, T-452D, Room C-1. The asbestos data reports are located in Cubicle C-13, of T-452D and the reports are under the control of Kevin Sheehan.

Interviewed by: J. R. Sheets / J R Sheets / 06/08/99
Print Name / Signature / Interview Date

89

Type 1 Facility Checklist

TYPE 1 FACILITY BUILDING B-987

CURRENT LANDLORD: RMRS

DATE OF COMPLETION: 02/29/00

ITEM	YES	NO
Does the facility contain radiological postings?		X
Does the facility contain chemical postings?		X
Are there any installed hazards?		X
Is there any information that indicates this facility was Impacted by DOE chemical and/or radiological operations?		X
Are there RCRA units within the facility		X
Is there a history of the building available?	X	
Is there any equipment/furniture left in the facility?		X
Is there a future mission identified for the facility?		X
Will the facility be left unsecured after it is vacated?		X

If any answer to any of the above questions is "Yes", complete the following questions and complete the "graded" PEP in accordance with Chapter 2.

Note: An answer of "Yes" to any question, specifically one dealing with hazards, ***may*** *indicate the facility is not a Type 1 Facility. Check with the D&D Programs office.*

If the answer to all question is "No" complete the "graded" PEP in accordance with Chapter 2.

1. List the Radiological Hazards, location, and quantity:

   Based on the historical data found and interviews taken there are no hazards in this building.

2. List the Chemical Hazards, location, and quantity:

   None. Based on historical data and interviews taken there are no chemical hazards in this building. There may be asbestos in the roof as it is Transite (ACM).

3. List the Physical Hazards:

   NONE

Final Survey NE Electra
Scan & Investigation Survey Map

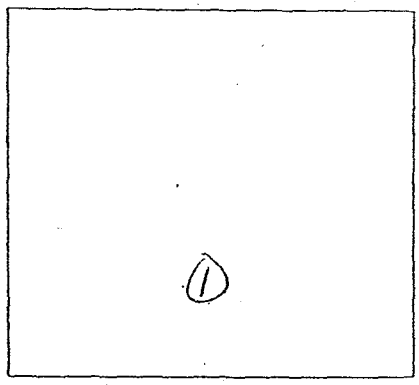
Survey Area:	Survey Unit:	Building:
NA	EXTERIOR	T 331 A
Survey Unit Description: 9 POINT INVESTIGATION AND Q.C. SCAN		
RCT Initials/Date: RC 3-9-00	RCT Initials/Date: N/A	RCT Initials/Date: N/A

Refer to the Final Survey NE Electra Scan & Investigation Survey Form for instrumentation, surveyor & approval information.

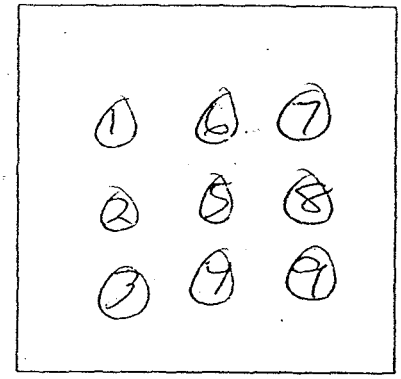
Legend: "R"- Roof, "W" – West Wall, "S" – South Wall, "E" – East Wall, "N" – North Wall "C" –Ceiling, "F" - Floor

Q.C. SCAN

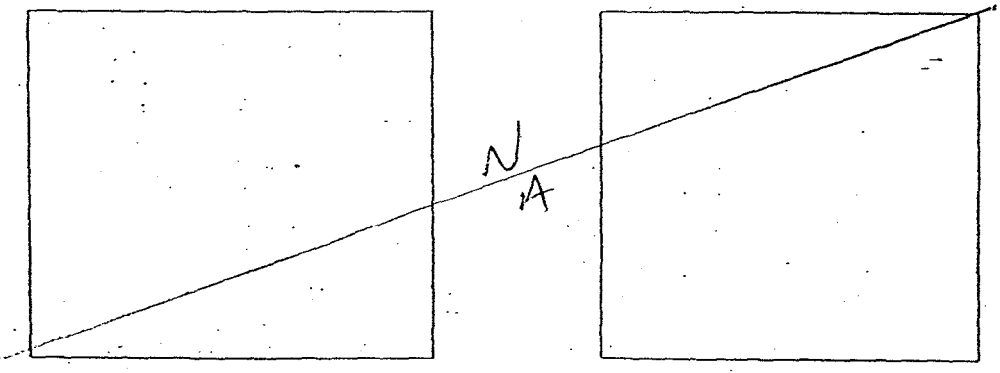
9 POINT INVESTIGATION



* 6-1 W



* A-16 R



*** Designates corner closest to A-1 point of reference**

Results/Comments:

Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm^2, unless noted on the survey form.

Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

T331A – Asbestos Inspector's Report

T331A

ASBESTOS INSPECTOR'S REPORT

I, the undersigned Certified Asbestos Inspector, certification # 1387 in the state of Colorado, attest to the asbestos inspection and sampling results as described below, for the following facility (at RFETS): Trailer 331A.

General Facility Location: east of and adjacent to Building 331.

INSPECTION RESULTS

Several materials within the trailer posed the potential for containing asbestos, as evidenced by the large number of samples from ceiling panels, drywall, linoleum, and base material beneath the carpet. One occurrence of asbestos was detected in sample –010, representing the entire floor of the trailer; however, the asbestos was not in a friable form. Fiberglass insulation was identified inside the walls.

116

SAMPLE RESULTS

Sample Number	Material Sampled & Location	Analytical Results
T331A-0308200005-001	Tan/white ceiling tile	None Detected
T331A-0308200005-002	Tan/white ceiling tile	None Detected
T331A-0308200005-003	White/gray wall covering; white/tan drywall	None Detected
T331A-0308200005-004	White/gray wall covering; white/tan drywall	None Detected
T331A-0308200005-005	White/gray wall covering; white/tan drywall	None Detected
T331A-0308200005-006	Gray/white mastic; white plaster; white linoleum	None Detected
T331A-0308200005-007	White linoleum	None Detected
T331A-0308200005-008	White mastic/plaster/linoleum	None Detected
T331A-0308200005-009	Tan mastic; white mastic/plaster/linoleum	None Detected
T331A-0308200005-010	Tan mastic; brown tile	12% Chrysotile; nonfriable
T331A-0309200005-001	Black Tar	None Detected

D&D Facility Characterization Interview Checklist

Type 1 Facility Checklist

D&D Facility Characterization Interview Checklist

ID No.: T-131A 32
Date: 02/01/00 6/5/00

Groups B & C Series

Check List for - Title: D&D Facility Characterization – Interviews

CRITERIA:
- Λ *D&D Characterization Protocol*, RFETS MAN-077-DDCP, Rev. 0
- Λ *Facility Disposition Program Manual*, RFETS MAN-076-FDPM
- Λ RFETS Radiological Safety Practices, January 12, 1998

Facility Name & Type (1, 2, or 3) T-131A Women firefighter sleeping quarters Type 1
Personnel Interviewed (Name & Title/Function) T. Parker / Fire Chief Ext.6043 Room 127

	-- Y/N --
Does a current WSRIC exist for the facility?	N
If so, are there exceptions to the WSRIC as written?	No WSRIC, No Exceptions

COMMENTS (incl. WSRIC contacts)
WSRIC Contact is James M. Schoen who is in charge of the WSRIC Reports, T130J, X3579, C-83.

Are rad surveys available that indicate current status of the facility?	N
Are historical rad surveys available that indicate historical status, or evolution, of the facility?	N*

COMMENT N* According to Chief Parker, Ext. 6043of KH any historical data, which is probably at the Federal Center, would not be adequate for unrestricted release. New monitor surveys would have to be taken.

Is an HRR available for the facility?	N
Do any other reports exist beyond the HRR (e.g., spill reports, reportable incidents, etc.) that further Characterize the facility relative to chemical &/or radiological contamination?	N**
Are engineering drawings (esp. "as-builts") available?	N*
Are any nonconformances or issues with the facility status currently being tracked in PATS?	N

If so, what are the issues (note in Comments, below)?

COMMENTS N* Radiological surveys may have been done, but the old data is not available. This unit will have to be resurveyed to meet present standards for unrestricted release. The Plant stopped using lead based paints for office buildings in 1989. If T-131A was painted prior to this date, lead based paints may have been used. N** According to Nick Demos, ER Characterization/HRR Manager, X4605, the T-131A trailer area has no historical information regarding spills to the environment. No engineering drawings or as-builts exist for the office trailer.

Have any types of chemical characterization, incl. asbestos, been performed recently?	Y*

If so, what types of characterization were performed (note in Comments, below)?

COMMENTS Y* Asbestos characterization data exists, according to Kevin Sheehan, X7250, T-452D, Room C-1. The asbestos data reports are located in Cubicle C-13, of T-452D and the reports are under the control of Kevin Sheehan.

Interviewed by: D.A.Burton / J.R. Sheets for D.A. Burton / 02/01/00

Print Name / Signature / Interview Date

121

D&D Facility Characterization Interview Checklist

ID No.: T -331A
Date: 02/01/00

What timeframe did the interviewee work in the facility? N/A The facility was sleeping quarters for women

From 1979 to 2000

Has the building configuration changed since you worked in the building? If so, in what way?

Y The facility was converted from an office trailer to sleeping quarters and a restroom shower room was added.

What types of equipment were in the building during the interviewee's time there?
Fire extinguishers, through the wall mounted air conditioners, wall mounted heaters.

Where was the equipment located? (specific rooms/areas) In and on the walls in the north and center rooms.

Were any radioactive materials or metals handled in the building? If so, what types? No, none

Which equipment handled radioactive material? N/A

Were any chemicals handled in the building? If so, what types? N/A

Did any spills or uncontrolled releases of radioactive materials or chemicals occur while you were working in the facility? No, none.

Were these spills/releases cleaned-up? How were they cleaned-up? N/A

Where did these spills/releases occur? N/A

Interviewed by: D,A,Burton / DR Sheets for D.A. Burton / 02/01/00

Print Name / Signature / Interview Date

Type 1 Facility Checklist

TYPE 1 FACILITY BUILDING T-331A

CURRENT LANDLORD: RFCSS

DATE OF COMPLETION: 02/29/00

ITEM	YES	NO
Does the facility contain radiological postings?		X
Does the facility contain chemical postings?		X
Are there any installed hazards?		X
Is there any information that indicates this facility was Impacted by DOE chemical and/or radiological operations?		X
Are there RCRA units within the facility		X
Is there a history of the building available?	X	
Is there any equipment/furniture left in the facility?		X
Is there a future mission identified for the facility?		X
Will the facility be left unsecured after it is vacated?		X

If any answer to any of the above questions is "Yes", complete the following questions and complete the "graded" PEP in accordance with Chapter 2.

Note: An answer of "Yes" to any question, specifically one dealing with hazards, ***may*** *indicate the facility is not a Type 1 Facility. Check with the D&D Programs office.*

If the answer to all question is "No" complete the "graded" PEP in accordance with Chapter 2.

1. List the Radiological Hazards, location, and quantity:

   Based on the historical data found and interviews taken there are no hazards in this trailer.

2. List the Chemical Hazards, location, and quantity:

   None. Based on historical data and interviews taken there are no chemical hazards in this trailer.

3. List the Physical Hazards:

   NONE

*** Designates corner closest to A-1 point of reference**

Results/Comments:
Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm², unless noted on the survey form.
Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

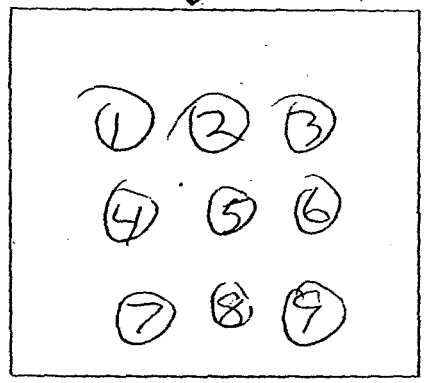
Final Survey NE Electra
Scan & Investigation Survey Map

Survey Area:	Survey Unit:	Building:
NA	EXTERIOR	T 771 D
Survey Unit Description: 9 POINT INVESTIGATION AND Q.C. SCAN		
RCT Initials/Date: PC 3-7-00	RCT Initials/Date: N/A	RCT Initials/Date: N/A

Refer to the Final Survey NE Electra Scan & Investigation Survey Form for instrumentation, surveyor & approval information.

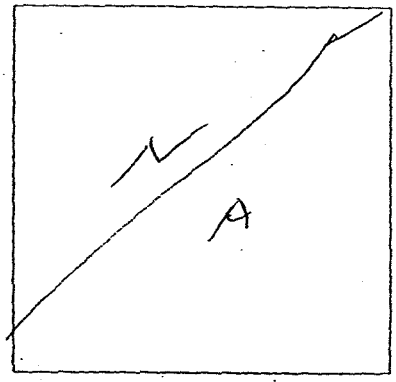
Legend: "R"- Roof, "W" – West Wall, "S" – South Wall, "E" – East Wall, "N" – North Wall "C" –Ceiling, "F" - Floor

9 POINT ROOF INVESTIGATION

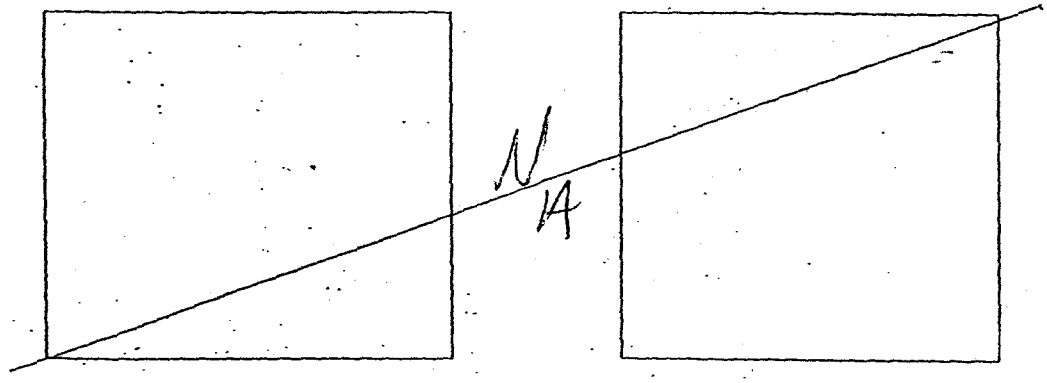


* L-2R

Q.C. SCAN



* K-15



*** Designates corner closest to A-1 point of reference**

Results/Comments:

Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm², unless noted on the survey form.

Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

T771D – Asbestos Inspector's Report

T771D

ASBESTOS INSPECTOR'S REPORT

I, the undersigned Certified Asbestos Inspector, certification # 1387 in the state of Colorado, attest to the asbestos inspection and sampling results as described below, for the following facility (at RFETS): Trailer 771D.

General Facility Location: Northwest Buffer Zone; east of current landfill.

INSPECTION RESULTS
Trailer 771D contains wood ceiling panels and fiberglass wall insulation. No other suspect asbestos containing materials were identified and no samples were collected.

SAMPLE RESULTS
None required; none taken.

Andre Gonzalez		7/12/00

D&D Facility Characterization Interview Checklist

Type 1 Facility Checklist

D&D Facility Characterization Interview Checklist

ID No:T771D
Date: 6/22/99

Groups B & C Series

Check List for - Title: D&D Facility Characterization – Interviews

CRITERIA:
- Λ *D&D Characterization Protocol*, RFETS MAN-077-DDCP, Rev. 0
- Λ *Facility Disposition Program Manual*, RFETS MAN-076-FDPM
- Λ RFETS Radiological Safety Practices, January 12, 1998

Facility Name & Type (1, 2, or 3) TRAILER (T771D), GROUP B TYPE 1 FACILITY, UNOCCUPIED OFFICE TRAILER
Personnel Interviewed (Name & Title/Function) JACK WEAVER(Retired), Currently B771 Contract Proj Mgr, X7571, Laura Reese, B771 Logistics, X4512

	– Y/N –
Does a current WSRIC exist for the facility?	N
If so, are there exceptions to the WSRIC as written?	No WSRIC, No Exceptions

COMMENTS (incl. WSRIC contacts)
WSRIC contact is James M. Schoen who is in charge of the WSRIC Reports, T130J, X3579, C-83.

Are rad surveys available that indicate current status of the facility?	N
Are historical rad surveys available that indicate historical status, or evolution, of the facility?	N

COMMENTS

Is an HRR available for the facility?	N
Do any other reports exist beyond the HRR (e.g., spill reports, reportable incidents, etc.) that further characterize the facility relative to chemical &/or radiological contamination?	N
Are engineering drawings (esp. "as-builts") available?	N
Are any nonconformances or issues with the facility status currently being tracked in PATS?	N

If so, what are the issues (note in Comments, below)?
COMMENTS

Have any types of chemical characterization, incl. Asbestos, been performed recently?	N

If so, what types of characterization were performed (note in Comments, below)?
COMMENTS No characterization data exist according to Kevin Sheehan, X7250, T452D, Room C-1, for asbestos. Kevin maintains a list of PACM buildings. No other potential hazardous information was located.

Interviewed by: Roy G. Alexander/ JR Shutts for Roy G. Alexander 6/17/99
Print Name Signature Interview Date

D&D Facility Characterization Interview Checklist

ID No:T771D
Date: 6/22/99

What timeframe did the interviewee work in the facility? Neither of the interviewee's worked in this trailer. They Know of the history due to their B771 tenure. Jack Weaver has worked in B771 since 1961, Laura Reese since 1991.

Has the building configuration changed since you worked in the building? If so, in what way? No.

What types of equipment were in the building during the interviewee's time there? This was an office facility. Only the forced air furnace and a copier.

Where was the equipment located? (specific rooms/areas) The furnace is currently still installed, it is located about midway of the trailer on the south wall, the copier was located about in the middle of the trailer on the north wall.

Were any radioactive materials or metals handled in the building? If so, what types? N/A

Which equipment handled radioactive material? N/A

Were any chemicals handled in the building? If so, what types? N/A

Did any spills or uncontrolled releases of radioactive materials or chemicals occur while you were working in the facility? No.

Were these spills/releases cleaned-up? How were they cleaned-up? N/A

Where did these spills/releases occur? N/A

Interviewed by: Roy Alexander / for Roy Alexander / 6/17/99

Print Name Signature Interview Date

Type 1 Facility Checklist

TYPE 1 FACILITY BUILDING T-771D

CURRENT LANDLORD: RMRS

DATE OF COMPLETION: 02/29/00

ITEM	YES	NO
Does the facility contain radiological postings?		X
Does the facility contain chemical postings?		X
Are there any installed hazards?		X
Is there any information that indicates this facility was Impacted by DOE chemical and/or radiological operations?		X
Are there RCRA units within the facility		X
Is there a history of the building available?	X	
Is there any equipment/furniture left in the facility?		X
Is there a future mission identified for the facility?		X
Will the facility be left unsecured after it is vacated?		X

If any answer to any of the above questions is "Yes", complete the following questions and complete the "graded" PEP in accordance with Chapter 2.

Note: An answer of "Yes" to any question, specifically one dealing with hazards, ***may*** *indicate the facility is not a Type 1 Facility. Check with the D&D Programs office.*

If the answer to all question is "No" complete the "graded" PEP in accordance with Chapter 2.

1. List the Radiological Hazards, location, and quantity:

   Based on the historical data found and interviews taken there are no hazards in this trailer.

2. List the Chemical Hazards, location, and quantity:

   None. Based on historical data and interviews taken there are no chemical hazards in this trailer. There may be asbestos in the floor tile and lead in the paint.

3. List the Physical Hazards:

   NONE

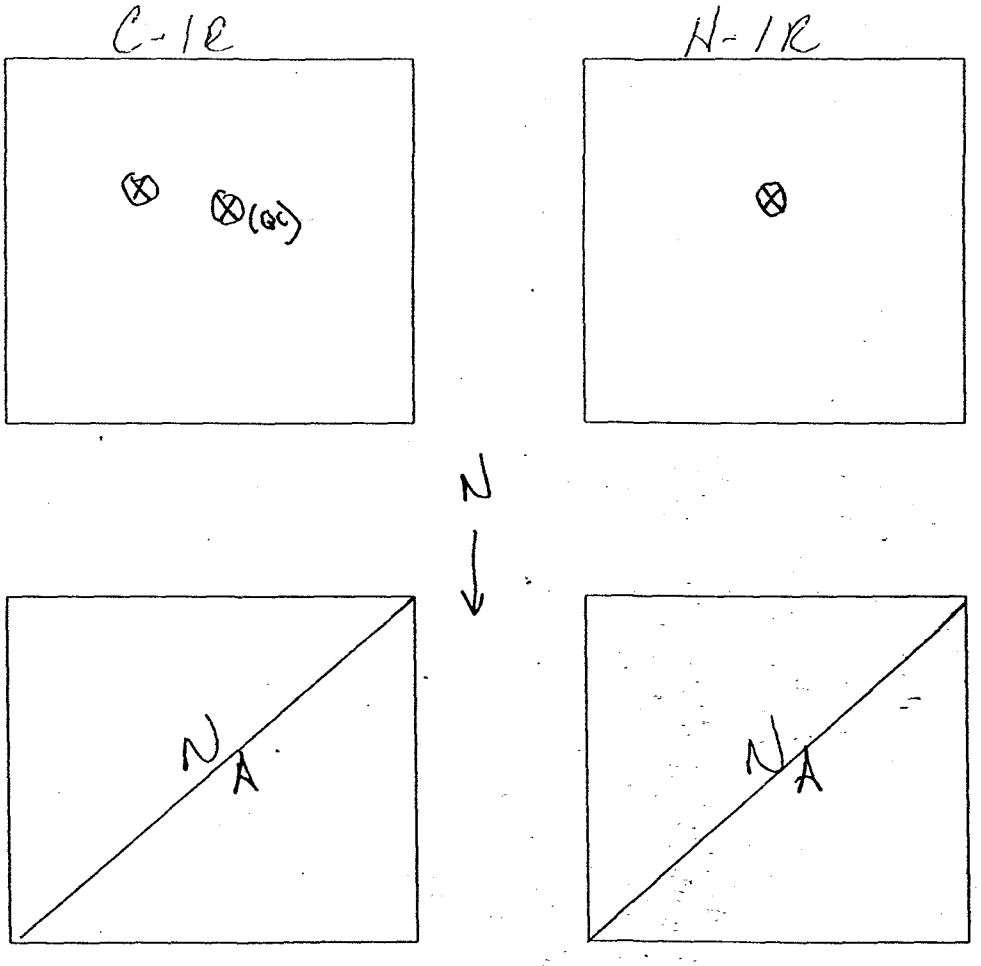
Survey Area: N/A	Survey Unit: EXTERIOR	Building: T331
Survey Unit Description: ROOF SAMPLE LOCATIONS		
RCT Initials/Date: MBR 3/28/00	RCT Initials/Date: NA	RCT Initials/Date: NA

Refer to the Final Survey NE Electra Scan & Investigation Survey Form for instrumentation, surveyor & approval information.

Legend: "R"- Roof, "W" – West Wall, "S" – South Wall, "E" – East Wall, "N" – North Wall "C" –Ceiling, "F" - Floor



⊗ SAMPLE CUT OUT

*** Designates corner closest to A-1 point of reference**

Results/Comments:
Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm², unless noted on the survey form.
Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

Final Survey NE Electra
Scan & Investigation Survey Map

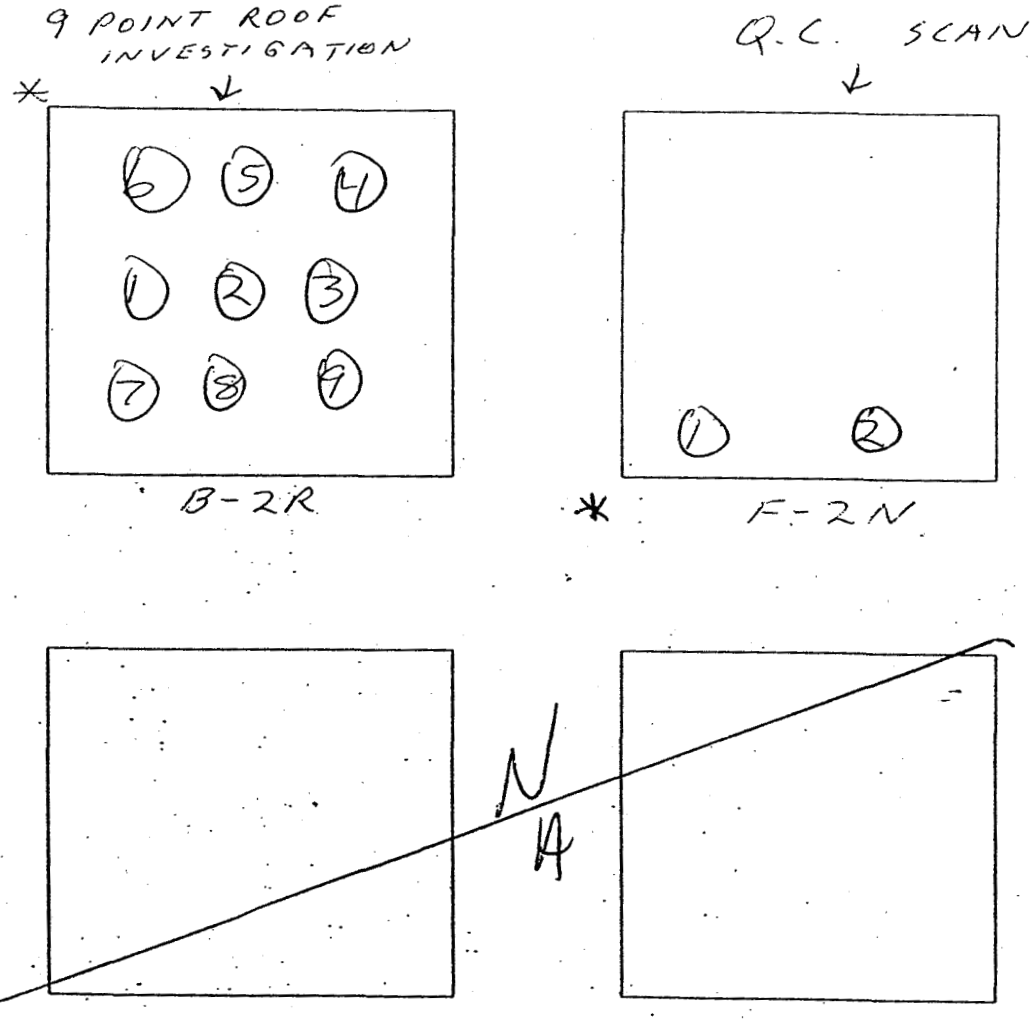
Survey Area:	Survey Unit:	Building:
N/A	EXTERIOR	T 331

Survey Unit Description: 9 POINT ROOF INVESTIGATION AND Q.C. SCANS

RCT Initials/Date: FC 3-7-00 RCT Initials/Date: N/A RCT Initials/Date: N/A

Refer to the Final Survey NE Electra Scan & Investigation Survey Form for instrumentation, surveyor & approval information.

Legend: "R"- Roof, "W" – West Wall, "S" – South Wall, "E" – East Wall, "N" – North Wall "C" –Ceiling, "F" - Floor



*** Designates corner closest to A-1 point of reference**

Results/Comments:

Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm², unless noted on the survey form.

Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

Final Survey NE Electra

T331 – Asbestos Inspector's Report

T331

ASBESTOS INSPECTOR'S REPORT

I, the undersigned Certified Asbestos Inspector, certification # 1387 in the state of Colorado, attest to the asbestos inspection and sampling results as described below, for the following facility (at RFETS): Trailer 331.

General Facility Location: North Buffer Zone by the current firing range.

INSPECTION RESULTS
No suspect asbestos containing materials were identified in Trailer 331 and no samples were collected. Fiberglass insulation was found throughout the walls.

SAMPLE RESULTS
None required; none taken.

Andre Gonzalez		7/12/00
INSPECTOR'S NAME	SIGNATURE	DATE

Type 1 Facility Checklist

Type 1 Facility Checklist

TYPE 1 FACILITY BUILDING T-331

CURRENT LANDLORD: RFCSS

DATE OF COMPLETION: 02/29/00

ITEM	YES	NO
Does the facility contain radiological postings?		X
Does the facility contain chemical postings?		X
Are there any installed hazards?		X
Is there any information that indicates this facility was Impacted by DOE chemical and/or radiological operations?		X
Are there RCRA units within the facility		X
Is there a history of the building available?	X	
Is there any equipment/furniture left in the facility?		X
Is there a future mission identified for the facility?		X
Will the facility be left unsecured after it is vacated?		X

If any answer to any of the above questions is "Yes", complete the following questions and complete the "graded" PEP in accordance with Chapter 2.

Note: An answer of "Yes" to any question, specifically one dealing with hazards, ***may*** *indicate the facility is not a Type 1 Facility. Check with the D&D Programs office.*

If the answer to all question is "No" complete the "graded" PEP in accordance with Chapter 2.

1. List the Radiological Hazards, location, and quantity:

   Based on the historical data found and interviews taken there are no hazards in this trailer.

2. List the Chemical Hazards, location, and quantity:

   None. Based on historical data and interviews taken there are no chemical hazards in this trailer.

3. List the Physical Hazards:

   NONE

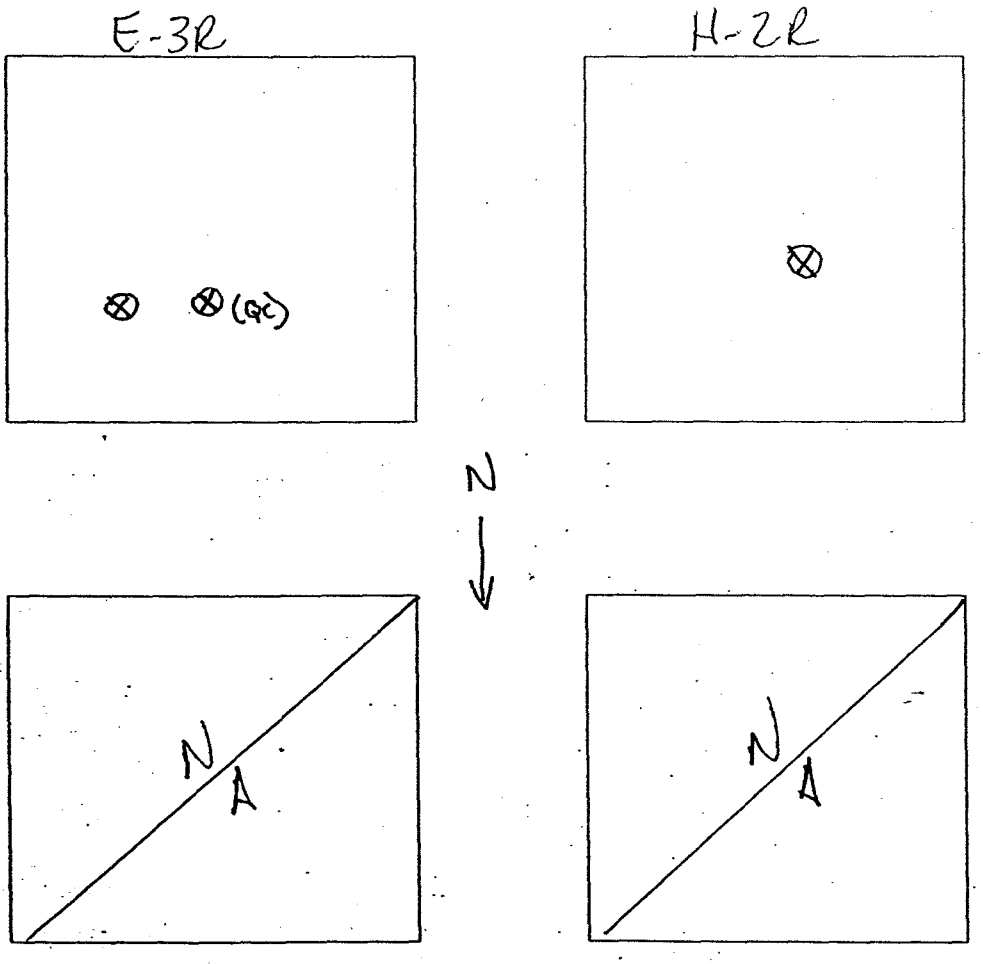
Final Survey NE Electra
Scan & Investigation Survey Map

Survey Area: N/A	Survey Unit: EXTERIOR	Building: T750E
Survey Unit Description: Roof Sample Locations		
RCT Initials/Date: [illegible] 3/28/00	RCT Initials/Date: NA	RCT Initials/Date: NA

Refer to the Final Survey NE Electra Scan & Investigation Survey Form for instrumentation, surveyor & approval information.

Legend: "R"- Roof, "W" – West Wall, "S" – South Wall, "E" – East Wall, "N" – North Wall "C" –Ceiling, "F" - Floor



⊗ SAMPLE CUT OUT

*** Designates corner closest to A-1 point of reference**

Results/Comments:
Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm², unless noted on the survey form.
Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

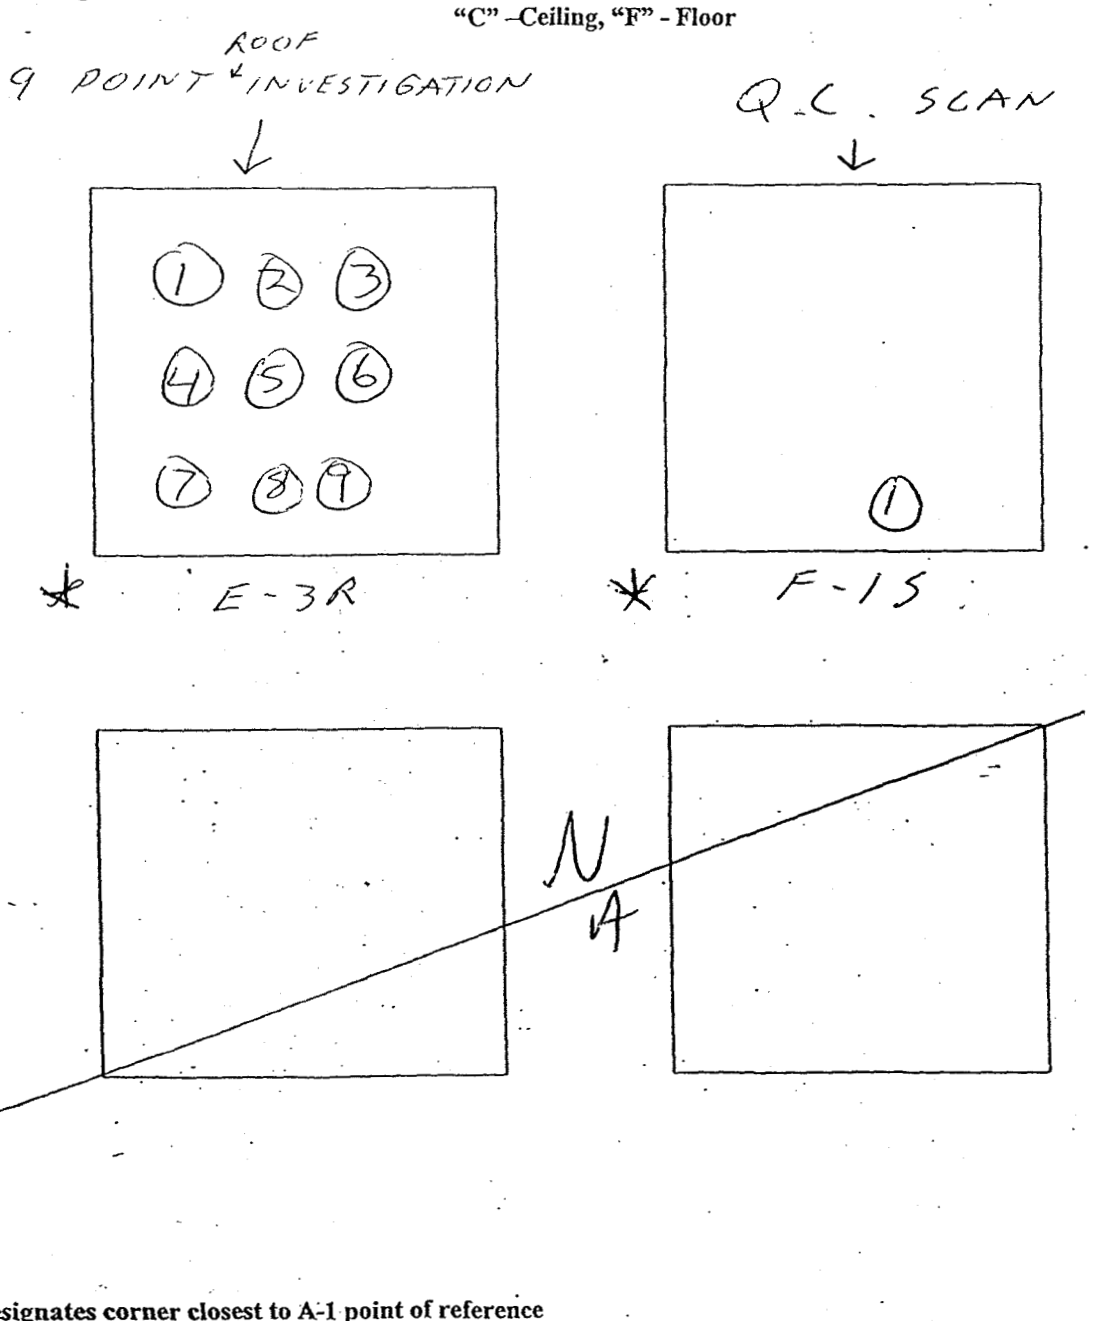
Survey Unit Description: 9 POINT ROOF INVESTIGATION AND Q.C. SCAN		
RCT Initials/Date: JL 3-7-00	RCT Initials/Date: N/A	RCT Initials/Date: N/A

Refer to the Final Survey NE Electra Scan & Investigation Survey Form for instrumentation, surveyor & approval information.

Legend: "R"- Roof, "W" – West Wall, "S" – South Wall, "E" – East Wall, "N" – North Wall "C" –Ceiling, "F" - Floor



*** Designates corner closest to A-1 point of reference**

Results/Comments:

Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm², unless noted on the survey form.

Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

T750E – Asbestos Inspector's Report

T750E

ASBESTOS INSPECTOR'S REPORT

I, the undersigned Certified Asbestos Inspector, certification # 1387 in the state of Colorado, attest to the asbestos inspection and sampling results as described below, for the following facility (at RFETS): Trailer 750E.

General Facility Location: North Buffer Zone; South of new firing range.

INSPECTION RESULTS

Trailer 750E contains ceiling tile, floor linoleum and drywall with no tape joint compound. Fiberglass insulation was found throughout the walls. The following table summarizes the results of the samples collected and the percent and type of asbestos detected:

SAMPLE RESULTS

Sample Number	Material Sampled & Location	Analytical Results
T750E-03012000-05-011	Brown sheet linoleum	20% Chrysotile in paper backing
T750E-03012000-05-012	Brown sheet linoleum	20% Chrysotile in paper backing
T750E-03012000-05-013	2' x 4' white ceiling tile	None Detected
T750E-03012000-05-014	2' x 4' white ceiling tile	None Detected
T750E-03012000-05-015	Drywall (no tape joint compound)	None Detected
T750E-03012000-05-016	Drywall (no tape joint compound)	None Detected
T750E-03012000-05-017	Drywall (no tape joint compound)	None Detected

Type 1 Facility Checklist

Type 1 Facility Checklist

TYPE 1 FACILITY BUILDING T-750E

CURRENT LANDLORD: RFCSS

DATE OF COMPLETION: 02/29/00

ITEM	YES	NO
Does the facility contain radiological postings?		X
Does the facility contain chemical postings?		X
Are there any installed hazards?		X
Is there any information that indicates this facility was impacted by DOE chemical and/or radiological operations?		X
Are there RCRA units within the facility		X
Is there a history of the building available?	X	
Is there any equipment/furniture left in the facility?		X
Is there a future mission identified for the facility?		X
Will the facility be left unsecured after it is vacated?		X

If any answer to any of the above questions is "Yes", complete the following questions and complete the "graded" PEP in accordance with Chapter 2.

Note: An answer of "Yes" to any question, specifically one dealing with hazards, ***may*** *indicate the facility is not a Type 1 Facility. Check with the D&D Programs office.*

If the answer to all question is "No" complete the "graded" PEP in accordance with Chapter 2.

1. List the Radiological Hazards, location, and quantity:

   Based on the historical data found and interviews taken there are no hazards in this trailer.

2. List the Chemical Hazards, location, and quantity:

   None. Based on historical data and interviews taken there are no chemical hazards in this trailer.

3. List the Physical Hazards:

   NONE

⊗ SAMPLE CUTOUT

*** Designates corner closest to A-1 point of reference**

Results/Comments:
Electra alpha scans were performed at the locations detailed on the survey map(s). All required accessible areas were scanned. All initial scan results were <225 dpm/100cm², unless noted on the survey form.
Electra beta scans were performed in required accessible areas. Initial scan results indicated no detectable activity above background unless noted on the survey form.

T903A – Asbestos Inspector's Report

T903A

ASBESTOS INSPECTOR'S REPORT

I, the undersigned Certified Asbestos Inspector, certification # 1387 in the state of Colorado, attest to the asbestos inspection and sampling results as described below, for the following facility (at RFETS): Trailer 903A.

General Facility Location: North Buffer Zone; South of existing firing range.

INSPECTION RESULTS

Trailer 903A contains two different types of floor tile. Fiberglass insulation was found throughout the walls. The following table summarizes the results of the samples collected and the percent and type of asbestos detected:

SAMPLE RESULTS

Sample Number	Material Sampled & Location	Analytical Results
T903A-03012000-05-007	12" X 12" White floor tile with tan mastic	None Detected
T903A-03012000-05-008	12" x 12" White floor tile with tan mastic	None Detected
T903A-03012000-05-009	Green sheet tile with brown mastic	None Detected
T903A-03012000-05-010	Green sheet tile with brown mastic	None Detected

Type 1 Facility Checklist

Type 1 Facility Checklist

TYPE 1 FACILITY BUILDING T-903A

CURRENT LANDLORD: RFCSS

DATE OF COMPLETION: 02/29/00

ITEM	YES	NO
Does the facility contain radiological postings?		X
Does the facility contain chemical postings?		X
Are there any installed hazards?		X
Is there any information that indicates this facility was Impacted by DOE chemical and/or radiological operations?		X
Are there RCRA units within the facility		X
Is there a history of the building available?	X	
Is there any equipment/furniture left in the facility?		X
Is there a future mission identified for the facility?		X
Will the facility be left unsecured after it is vacated?		X

If any answer to any of the above questions is "Yes", complete the following questions and complete the "graded" PEP in accordance with Chapter 2.

Note: An answer of "Yes" to any question, specifically one dealing with hazards, ***may*** *indicate the facility is not a Type 1 Facility. Check with the D&D Programs office.*

If the answer to all question is "No" complete the "graded" PEP in accordance with Chapter 2.

1. List the Radiological Hazards, location, and quantity:

   Based on the historical data found and interviews taken there are no hazards in this trailer.

2. List the Chemical Hazards, location, and quantity:

   None. Based on historical data and interviews taken there are no chemical hazards in this trailer. There may be lead in the paint used in this trailer.

3. List the Physical Hazards:

   NONE

SURVEY PACKAGE CALCULATION WORKSHEET

Package ID: 2000-01	**Building:** T771D
Survey Area: Not Applicable	**Survey Unit:** Interior
Survey Unit Description: This trailer was placed at its current location in 1969. This unit is 12'x40'x 10' high.	

X **Total Surface Activity**	☐ **Media Surface Activity**
X **Removable Surface Activity**	☐ **Volumetric Surface Activity**

Step 1: Calculate the relative shift Δ/σ_s.

$\Delta/\sigma_s = (DCGL\text{-}LBGR)/\sigma_s$

$\Delta/\sigma_s = 1.0$

where:
A value of 1.0 was chosen since no survey data is available and Δ/σ_s may vary between 1.0 and 3.0. The use of 1.0 maximizes the number of surveys required.

Step 2: Determine Sign p using the calculated relative shift and Table 7-1. Sign p is the estimated probability that a random measurement from the survey unit will be less than the $DCGL_w$ when the survey unit median is actually at the LBGR. Sign p = 0.841345

Step 3: Determine Decision Error Percentiles for $Z_{1-\alpha}$ and $Z_{1-\beta}$ and the selected decision error levels α and β. Typical (α) and (β) values used at RFETS are 0.05 and 0.05 respectively. This yields a $Z_{1-\alpha}$ and $Z_{1-\beta}$ value of 1.645 and 1.645 respectively.

Step 4: Calculate Number of Data Points (N) for Sign Test using the following equation:

$$N = \frac{(Z_{1-\alpha} + Z_{1-\beta})^2}{4(Sign\,p - 0.5)^2} = 23.22$$

Step 5: Increase the number of data points by 20% to ensure sufficient power of the tests and to allow for possible data losses. 23.22*1.2 = 27.86

Conclusion:

A total of 28 data points will be needed to satisfy MARSSIM statistical requirements.

Note: Where TSA results are elevated due to Po-210 concentrations, the Post Survey calculations can indicate that more survey points are needed. These numbers are artificially high because the elevated results are due to Po-210, and not due to DOE-added radionuclides. Consequently, where the presence of NORM (specifically Po-210) is confirmed through alpha spec analysis, Post Survey Statistics Calculations that use survey (TSA) results are not applicable as a means of checking TSA survey frequencies. Adequate survey frequency would be indicated if results attained from analytical samples were used instead.

OASIS Direct Analysis Measurement Result Information

The samples listed below were analyzed using the Oxford Alpha Spectroscopy Integrated System (OASIS) at the Rocky Flats Environmental Technology Site. These samples were counted directly in the alpha spectrometer chambers, without chemical preparation. The technical basis for this type of analysis has been established in TBD-00143, Direct Analysis of Alpha Emitters Using the Oxford Alpha Spectroscopy Integrated System (OASIS), and TBD-00153, Use of the OASIS for Direct Differentiation between Po-210 and DOE-enhanced Materials.

In order to maintain the quality of OASIS measurements, the instrument is performance tested in accordance with Operations Order OO-771-228, Direct Analysis of Alpha Emitters Using the Oxford Alpha Spectroscopy Integrated System (OASIS). This Operations Order establishes the periodicity of performance test and background measurements, and the criteria against which these measurements are judged. All samples are counted by RCTs or REs qualified per JPM 036-119-53, Direct Analysis of Alpha Emitters Using the Oxford Alpha Spectroscopy Integrated System (OASIS) and approved by qualified REs.

A sample of the calibration and performance test data is attached for your review. All such data are maintained by the OASIS analysts and are available for your perusal.

The samples were 1-in coupons with an area of 4.82 cm^2. Calculation of the activity per 100 cm^2 was performed assuming that samples were representative. Errors are quoted at one standard deviation, accounting for all associated analytical uncertainties. Uranium results refer to the presence of U-238, U-234, or U-235.

OASIS Direct Analysis Measurement Result Information

Two samples were received on 6/1/2000. The samples were 1-in coupons with an area of 4.82 cm^2.

The samples were analyzed using the Oxford Alpha Spectroscopy Integrated System (OASIS) at the Rocky Flats Environmental Technology Site. These samples were counted directly in the alpha spectrometer chamber, without chemical preparation. The basis for this type of analysis has been established in TBD-00143, Direct Analysis of Alpha Emitters Using the Oxford Alpha Spectroscopy Integrated System (OASIS), and TBD-00153, Use of the OASIS for Direct Differentiation between Po-210 and DOE-added Materials.

In order to maintain the quality of OASIS measurements, the instrument is performance tested in accordance with Operations Order OO-771-228, Direct Analysis of Alpha Emitters Using the Oxford Alpha Spectroscopy Integrated System (OASIS). This Operations Order establishes the periodicity of performance test and background measurements, and the criteria against which these measurements are judged. All samples are counted by RCTs or REs qualified per JPM 036-119-53, Direct Analysis of Alpha Emitters Using the Oxford Alpha Spectroscopy Integrated System (OASIS), and approved by qualified REs.

Calculation of the activity per 100 cm^2 was performed assuming that the activity was homogeneously distributed. Errors are quoted at two standard deviations in the final results, accounting for all associated analytical uncertainties. Uranium results refer to the presence of U-238, U-234, or U-235.

Sample ID	OASIS dpm ± 1s		dpm/100cm^2 ± 2s	
00A1148-040.001 D2R1	24.3	0.5	504	19
00A1148-041.001 D2RQC	30.7	0.9	637	35

Sample ID	Count time (seconds)	Detection Sensitivity dpm/100cm^2			
		Pu+Am	Pu-239	Am-241	U
00A1148-040.001 D2R1	43200	20	17	2	20
00A1148-041.001 D2RQC	10800	79	70	10	79

Peaks for Pu-239, Am-241, and uranium were not identified in the spectra.

Data Package Narrative

Four waste samples, under the Subcontract Number KH700331EP6, were received on May 15, 2000. Four samples were analyzed by Alpha Spectroscopy for Polonium-210, Plutonium 239/240, Uranium-233/234,235,238, and Americium 241.

- Analytical Method: EPI A-011 (Alpha Spec)
- Matrix Interferences: There are no matrix interferences to report.
- QC Deficiencies: There were no deficiencies.
- Hold Times: All samples were analyzed within the required holding time.
- RDLs: There were no failed detection limits.
- Reanalysis Information: There were no reanalysis of the samples.
- Deviations from SOP: See following page.

Comments:

1. RC01CAL_EPI_3-JUN-2000, RC01CAL_EPI_4-JUN-2000 correspond to RC01CAL_EPI_01JUN2000.
2. The following samples did not meet the FWHM requirement of < 80 keV.

1000060362_PU	94 keV
1000060364_PU	92 keV
1000061142_UU	85 keV

3. Sample 00A1148-031.002, 00A1148-034.002 and QC 1000061142 were recounted due to failed yield.
